Geometric Modeling II

Spline Surfaces
Subdivision

Bernstein Basis

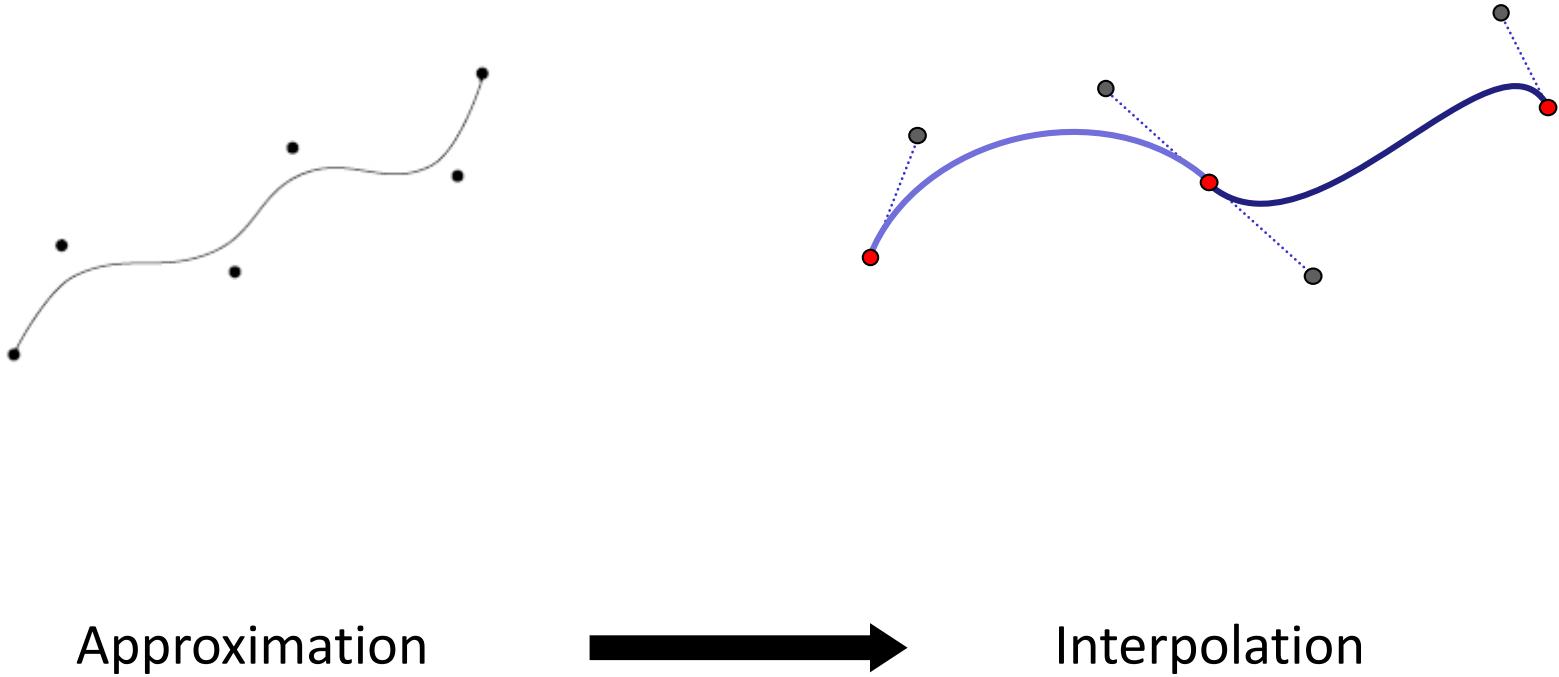

de Casteljau algorithm

Bernstein form

Towards Bezier Splines

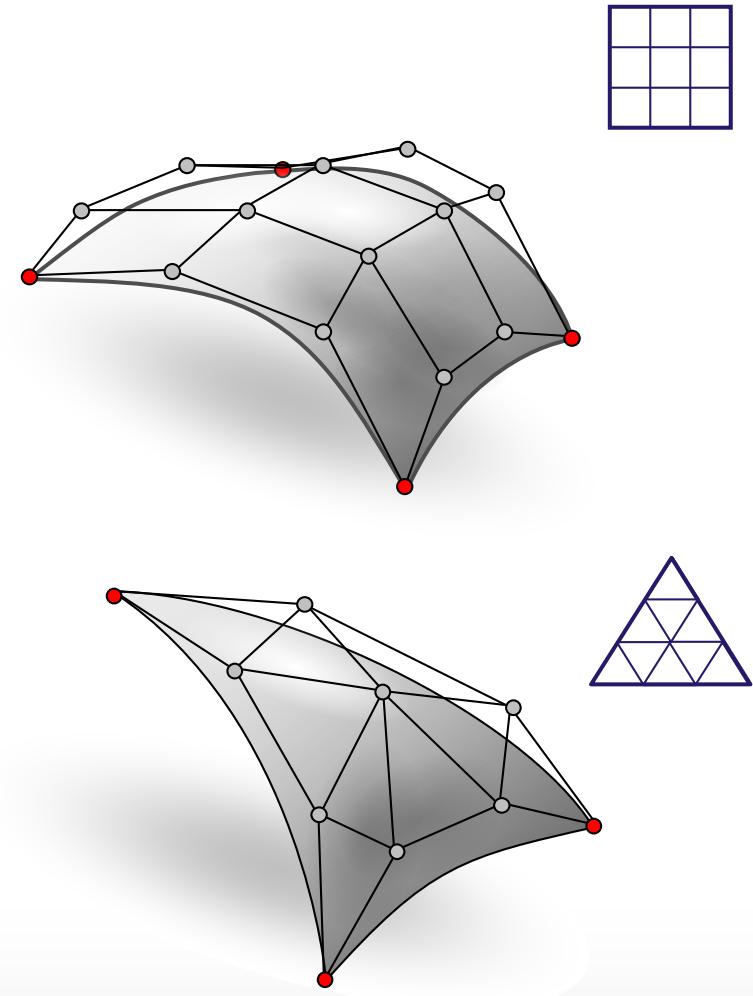

Spline Surfaces

Spline Surfaces

Two different approaches

- Tensor product surfaces
 - Simple construction
 - Everything carries over from curve case
 - Quad patches
 - Degree anisotropy
- Total degree surfaces
 - Not as straightforward
 - Isotropic degree
 - Triangle patches
 - “Natural” generalization of curves

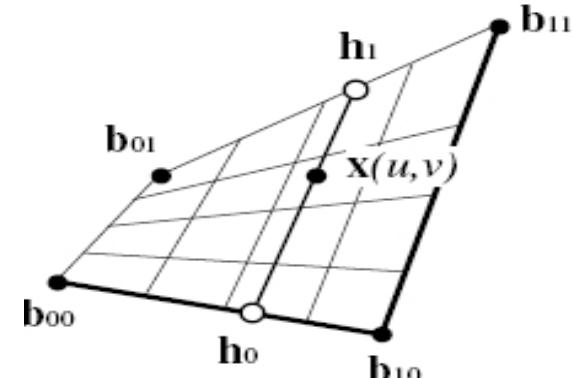

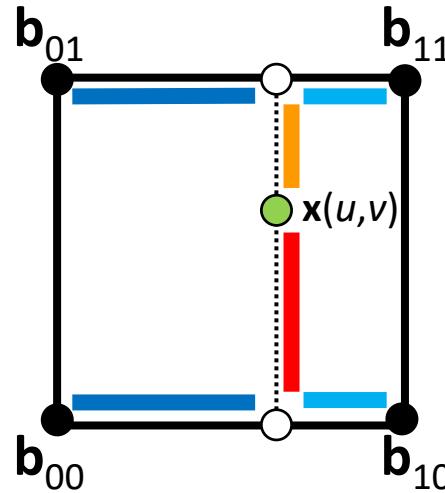

Tensor Product Surfaces

Tensor Product Bezier Surfaces

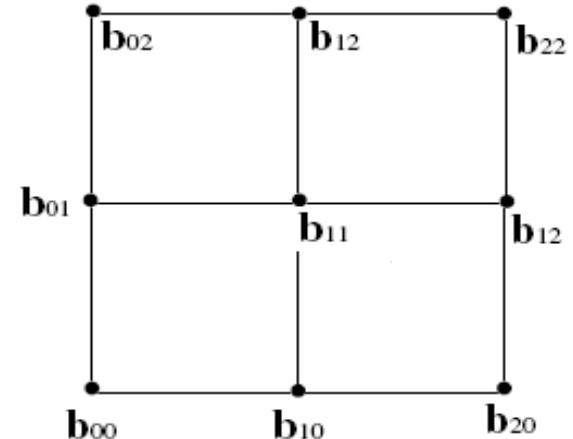

Bezier curves:
repeated linear interpolation

now a different setup:
4 points $\mathbf{b}_{00}, \mathbf{b}_{10}, \mathbf{b}_{11}, \mathbf{b}_{01}$
parameter area $[0,1] \times [0,1]$

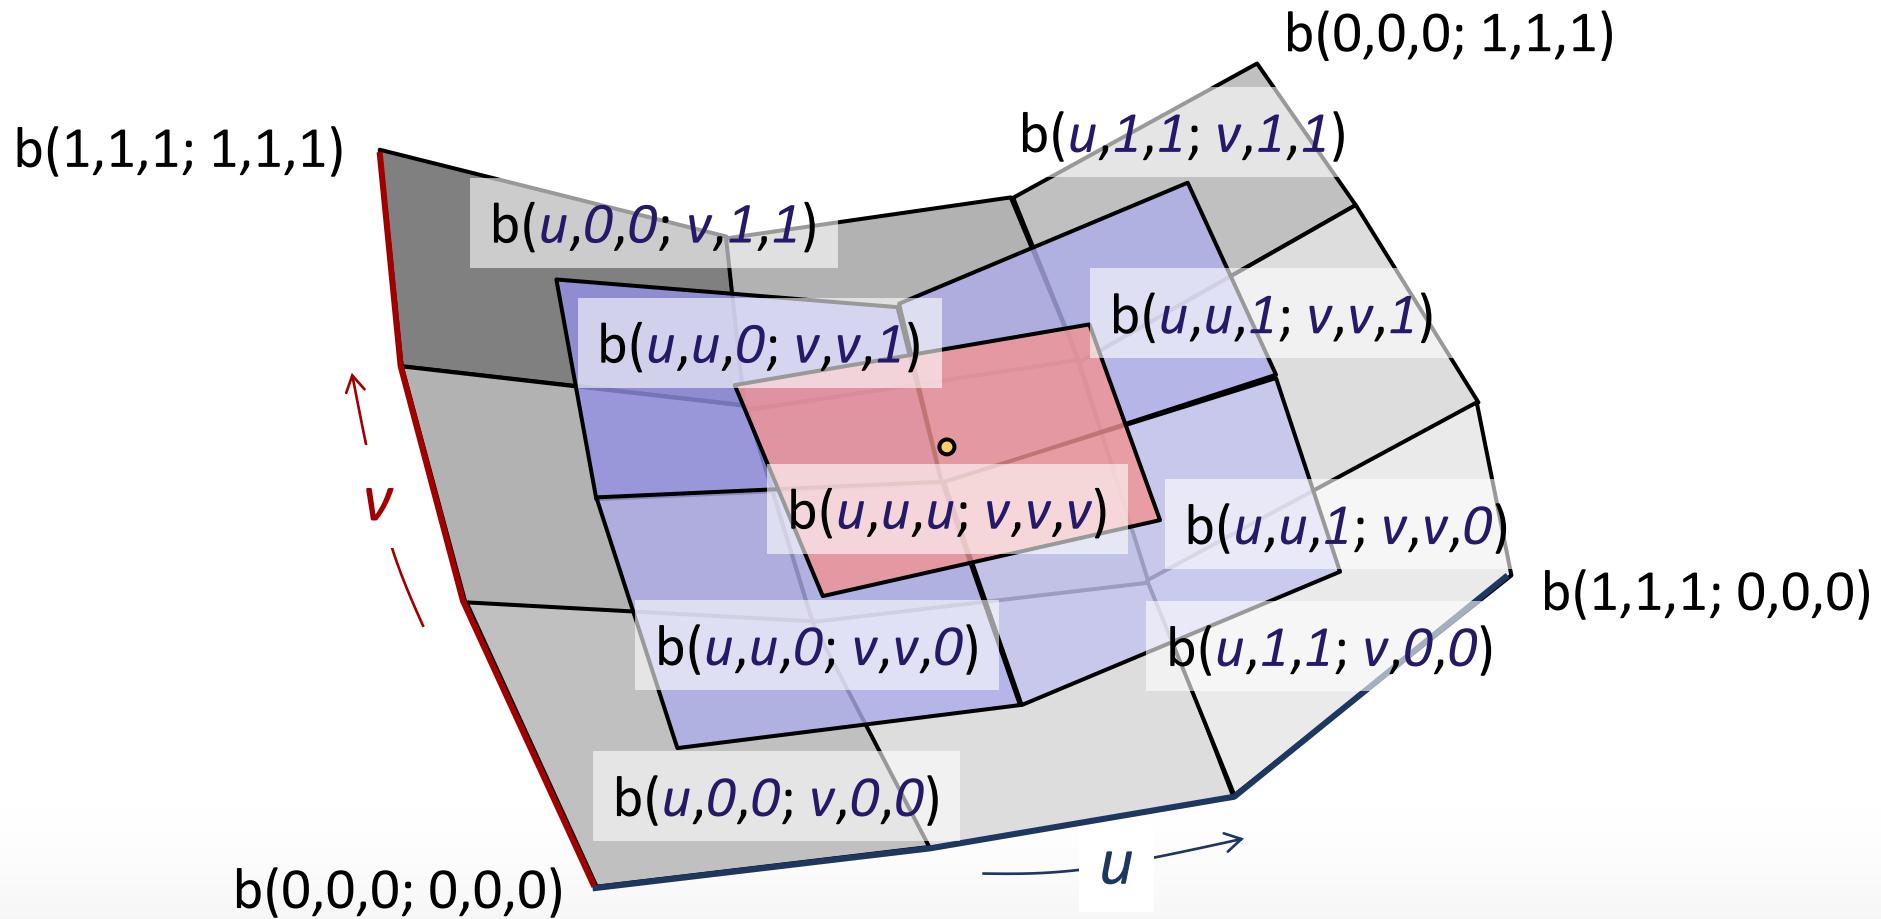

→ bilinear interpolation:
repeated linear interpolation

→ repeated bilinear interpolation:
gives us tensor product Bezier surfaces
(example shows quadratic Bezier surface)

De Casteljau Algorithm

De Casteljau algorithm for tensor product surfaces:

Tensor Product Surfaces

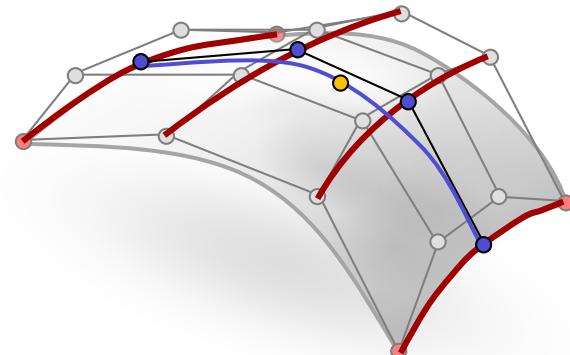

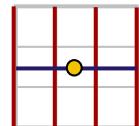

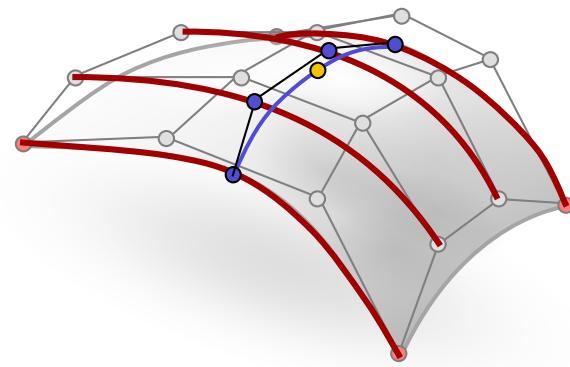

Tensor Product Surfaces:

$$\mathbf{f}(u, v) = \sum_{i=1}^n \sum_{j=1}^n b_i(u) b_j(v) \mathbf{p}_{i,j}$$

$$= \sum_{i=1}^n b_i(u) \sum_{j=1}^n b_j(v) \mathbf{p}_{i,j}$$

$$= \sum_{j=1}^n b_j(v) \sum_{i=1}^n b_i(u) \mathbf{p}_{i,j}$$

- “Curves of Curves”
- Order does not matter

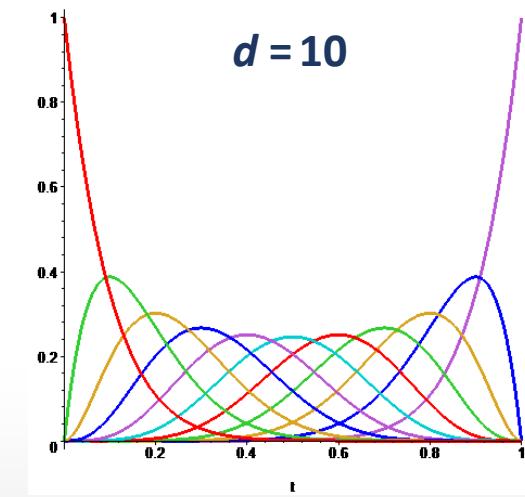

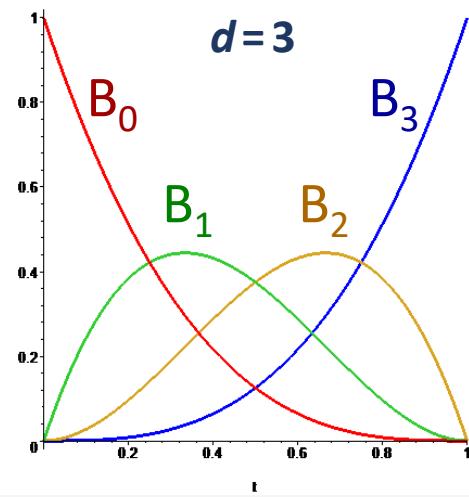

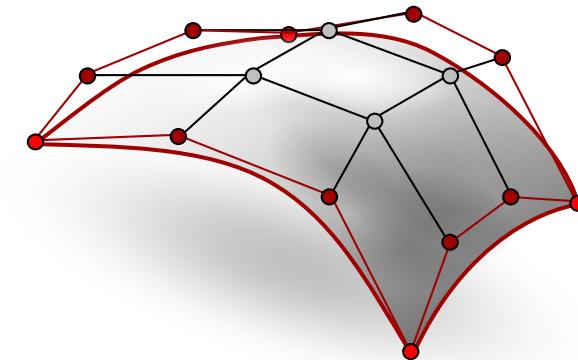

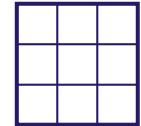

Tensor Product Surfaces

Bezier Patches

Bezier Patches

Bezier Patches:

- Remember endpoint interpolation:
 - Boundary curves are Bezier curves of the boundary control points

Continuity Conditions

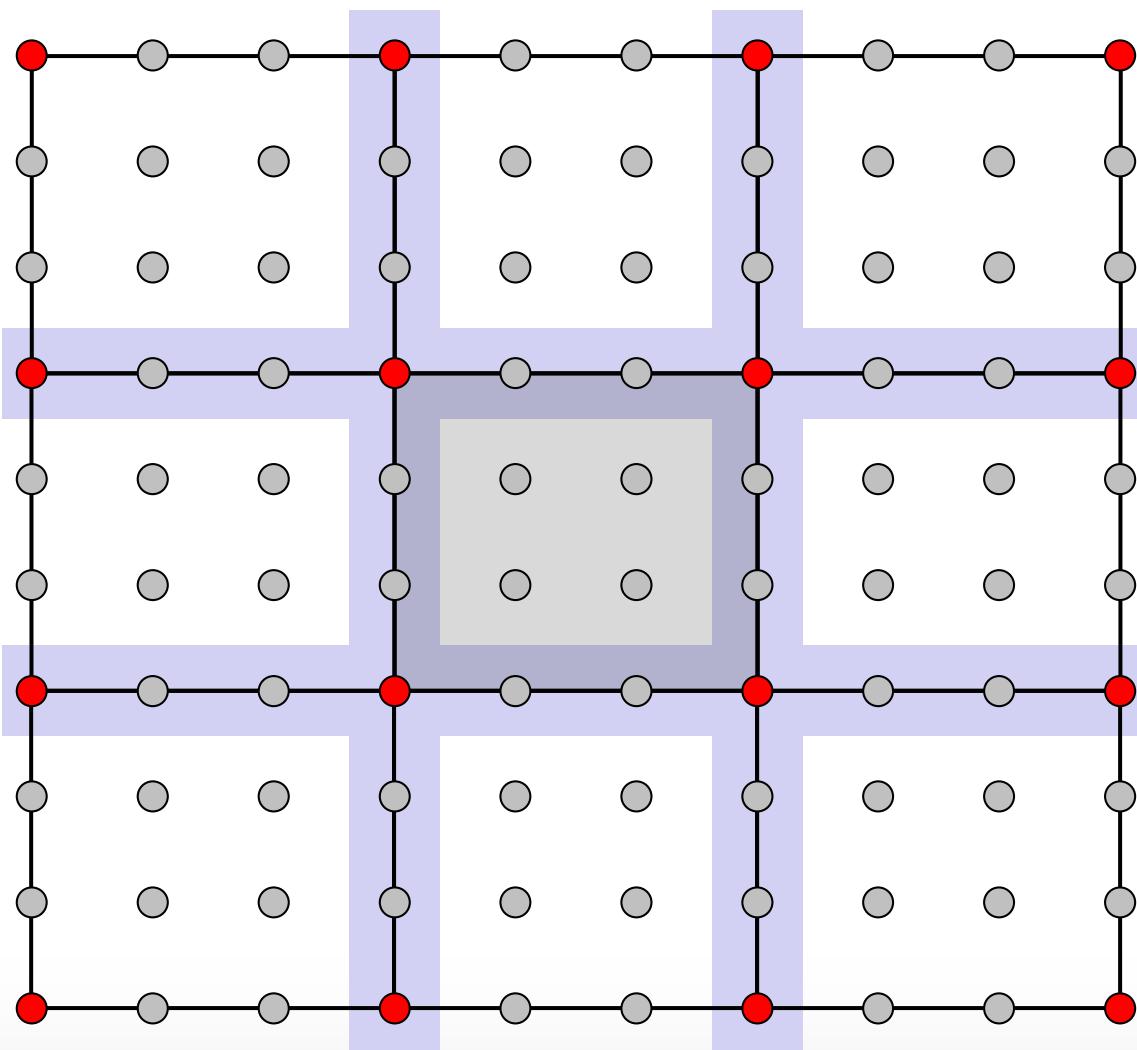

For C^0 continuity:

- Boundary control points must match

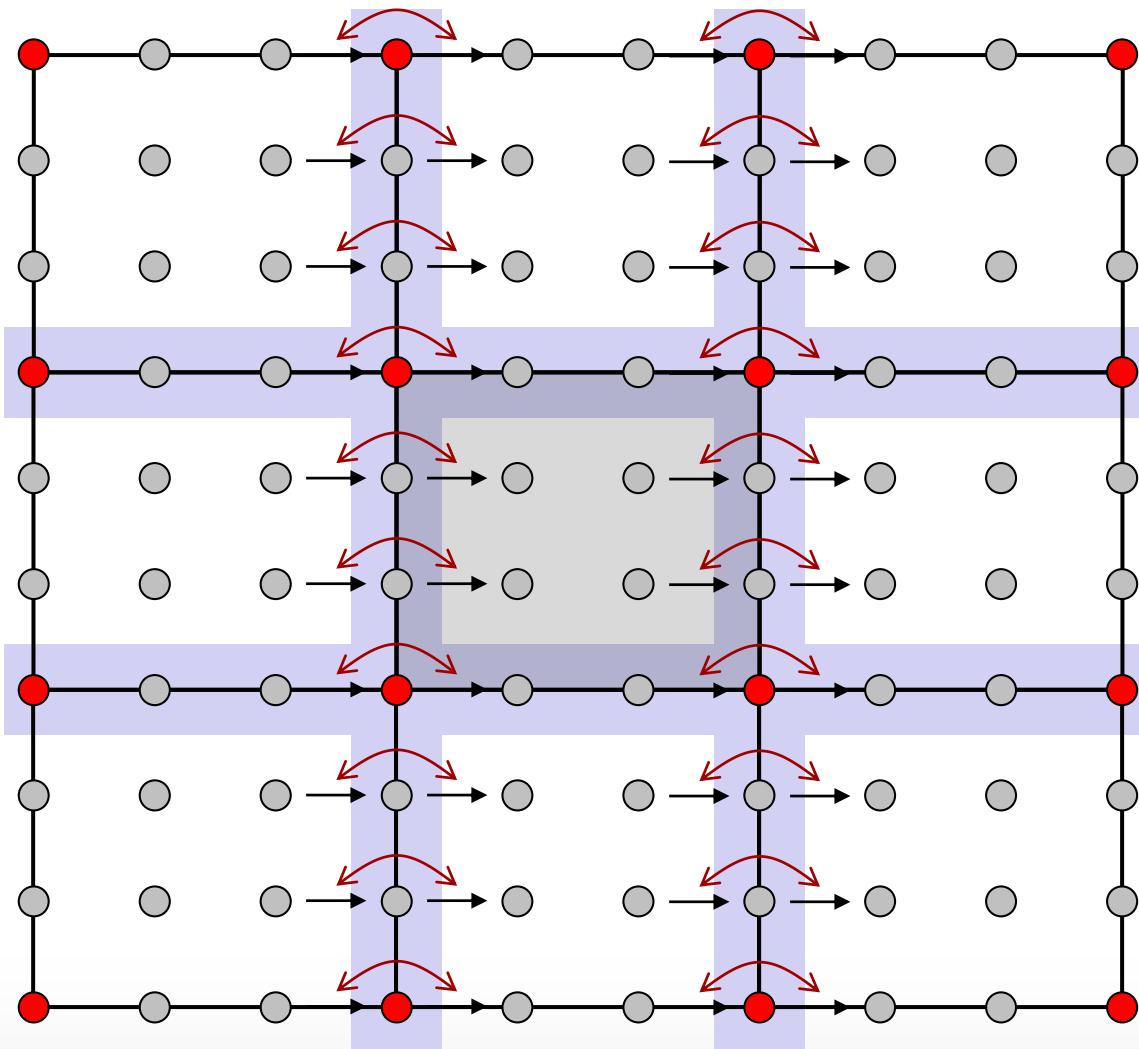

For C^1 continuity:

- Difference vectors must match at the boundary

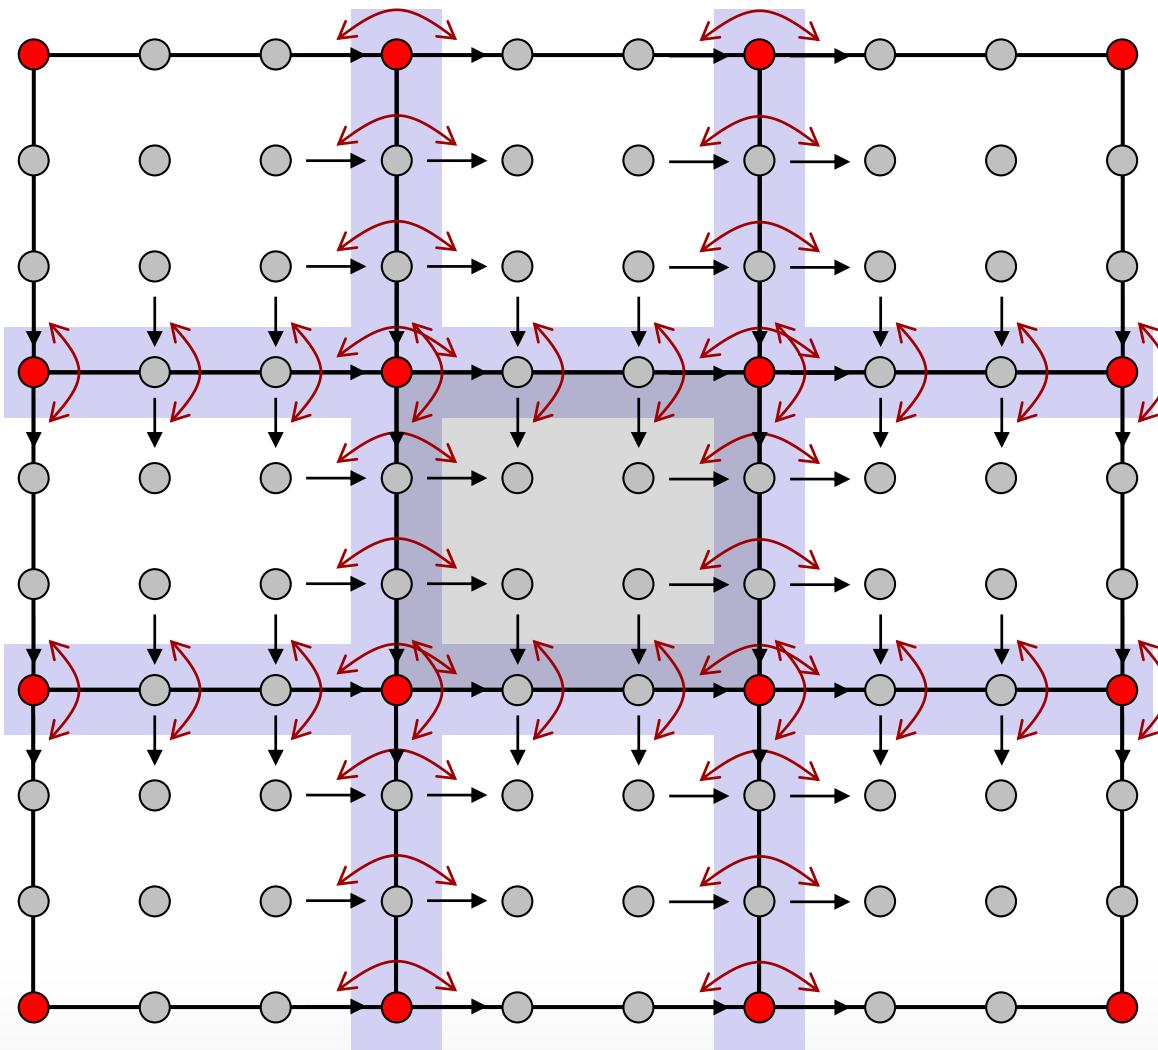

C^0 Continuity

C^1 Continuity

C^1 Continuity

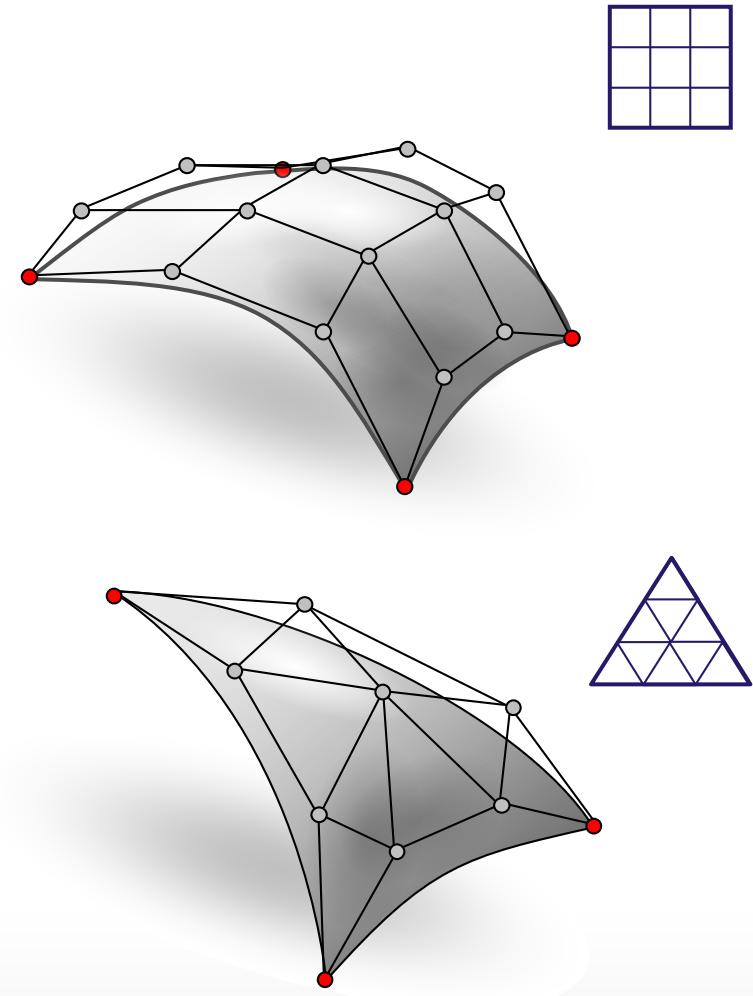

Total Degree Surfaces

Spline Surfaces

Two different approaches

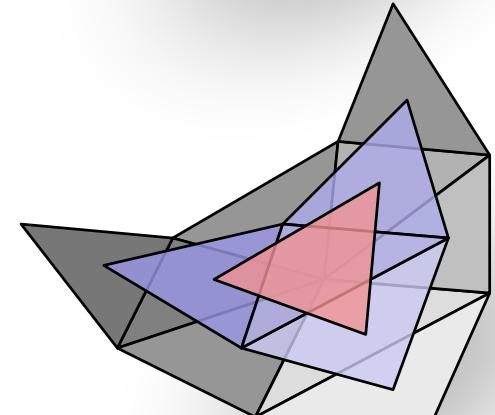

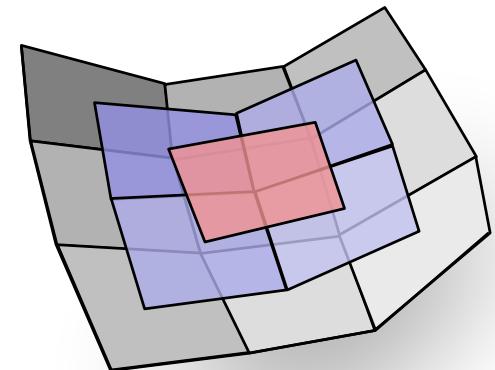

- Tensor product surfaces
 - Simple construction
 - Everything carries over from curve case
 - Quad patches
 - Degree anisotropy
- Total degree surfaces
 - Not as straightforward
 - Isotropic degree
 - Triangle patches
 - “Natural” generalization of curves

Bezier Triangles

Alternative surface definition: Bezier triangles

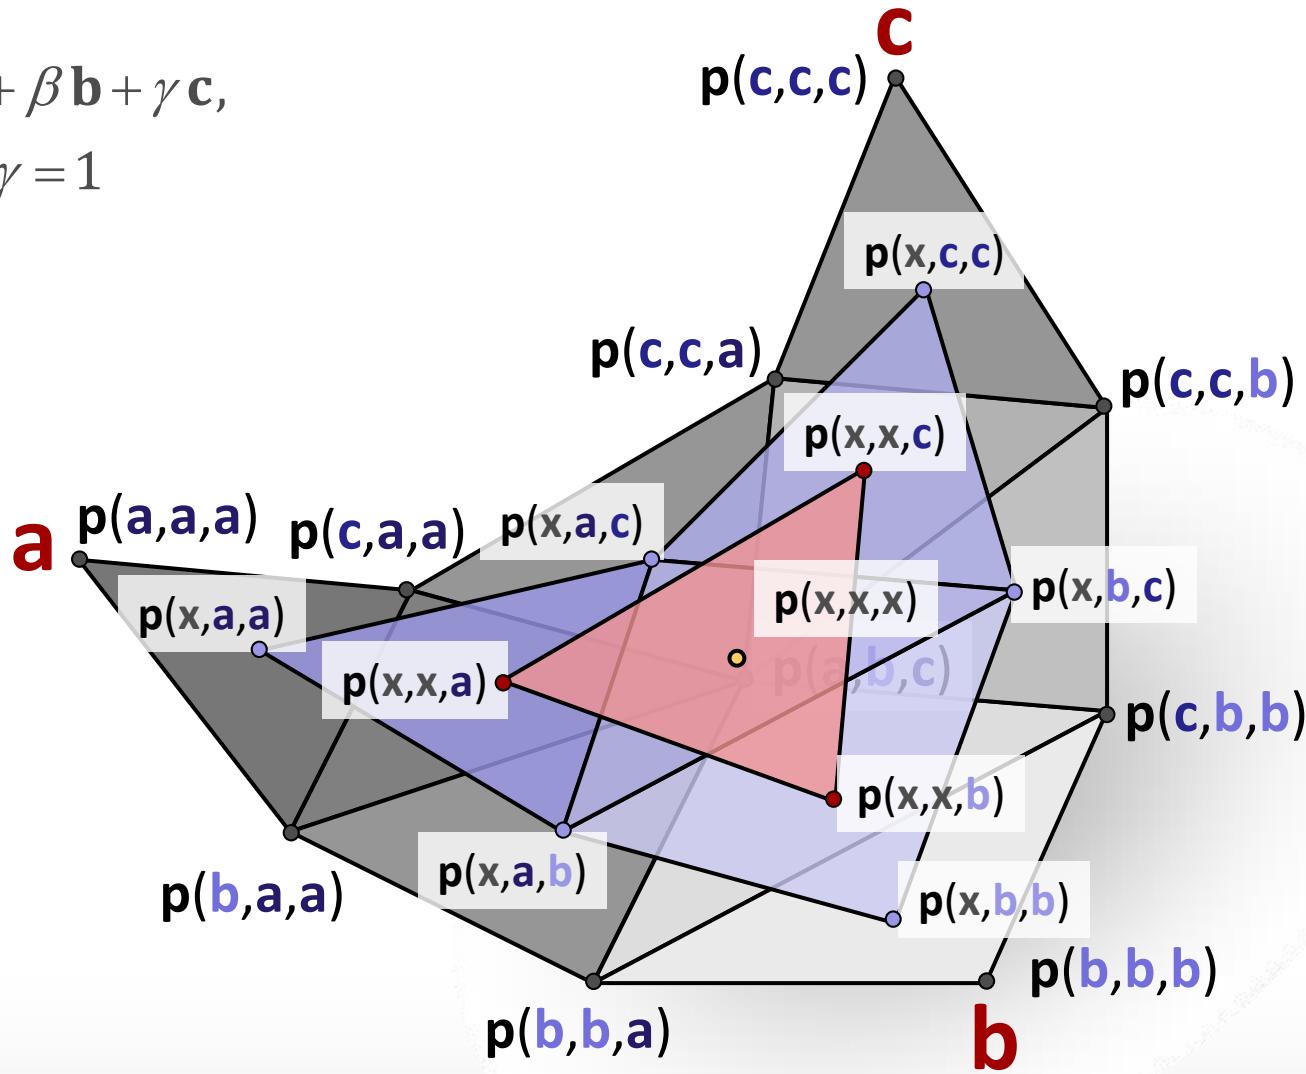

- Constructed according to given total degree
 - Completely symmetric:
No degree anisotropy
- Can be derived using a triangular de Casteljau algorithm
 - Barycentric interpolation

De Casteljau Algorithm

$$\mathbf{x} = \alpha \mathbf{a} + \beta \mathbf{b} + \gamma \mathbf{c},$$

$$\alpha + \beta + \gamma = 1$$

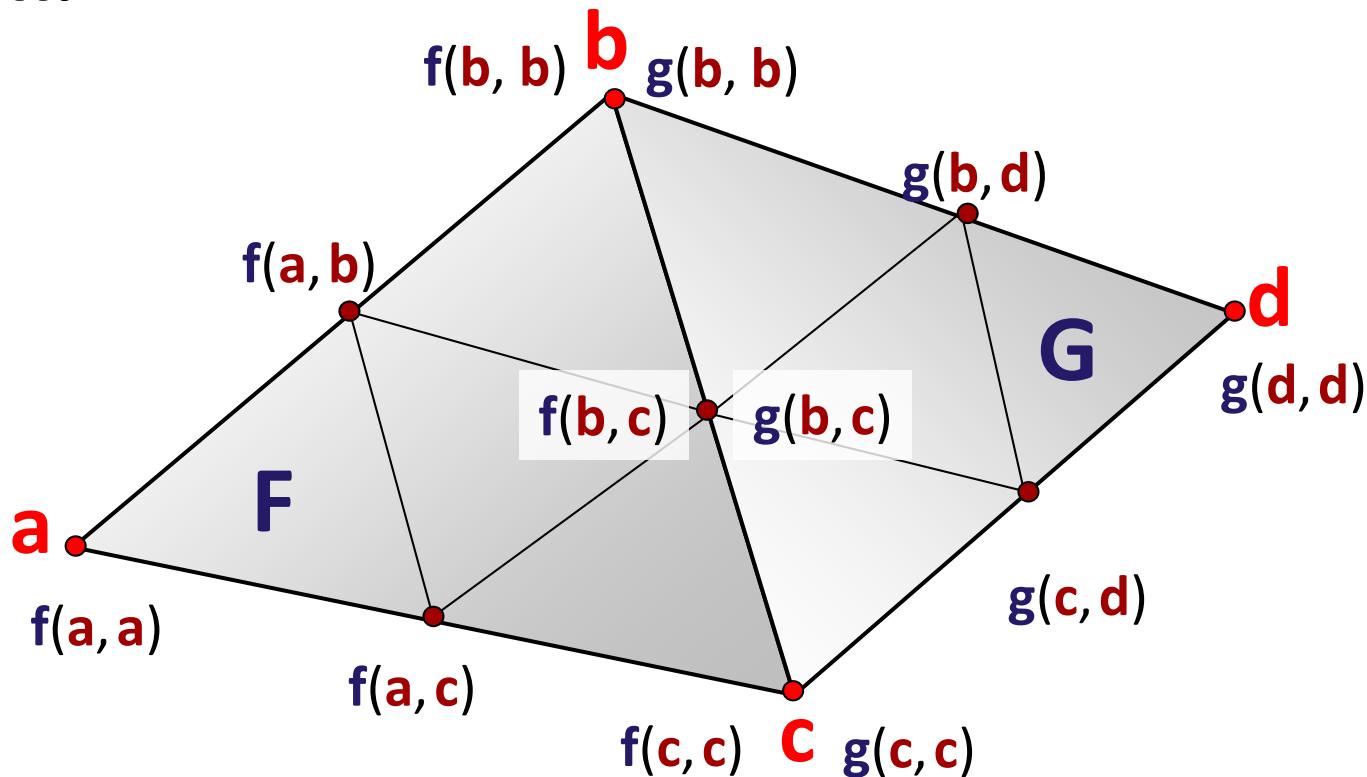

Continuity

We need to assemble Bezier triangles continuously:

- What are the conditions for C^0 , C^1 continuity?

Continuity

Situation:

Continuity

C⁰ Continuity:

- The points on the boundary have to agree:

$$f(\mathbf{b}, \mathbf{b}) = g(\mathbf{b}, \mathbf{b})$$

$$f(\mathbf{b}, \mathbf{c}) = g(\mathbf{b}, \mathbf{c})$$

$$f(\mathbf{c}, \mathbf{c}) = g(\mathbf{c}, \mathbf{c})$$

- Proof: Let $\mathbf{x} := \beta \mathbf{b} + \gamma \mathbf{c}$, $\beta + \gamma = 1$

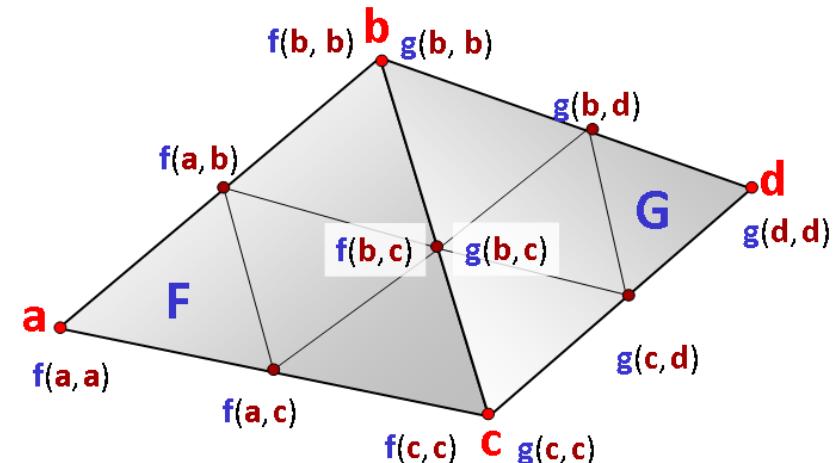

$$f(\mathbf{x}, \mathbf{x}) = \beta f(\mathbf{b}, \mathbf{x}) + \gamma f(\mathbf{c}, \mathbf{x})$$

$$= \beta^2 f(\mathbf{b}, \mathbf{b}) + 2\beta\gamma f(\mathbf{b}, \mathbf{c}) + \gamma^2 f(\mathbf{c}, \mathbf{c})$$

$$\begin{array}{ccc} \parallel & \parallel & \parallel \\ g(\mathbf{b}, \mathbf{b}) & g(\mathbf{b}, \mathbf{c}) & g(\mathbf{c}, \mathbf{c}) \end{array}$$

$$= \beta^2 g(\mathbf{b}, \mathbf{b}) + 2\beta\gamma g(\mathbf{b}, \mathbf{c}) + \gamma^2 g(\mathbf{c}, \mathbf{c})$$

$$= \beta g(\mathbf{b}, \mathbf{x}) + \gamma g(\mathbf{c}, \mathbf{x}) = g(\mathbf{x}, \mathbf{x})$$

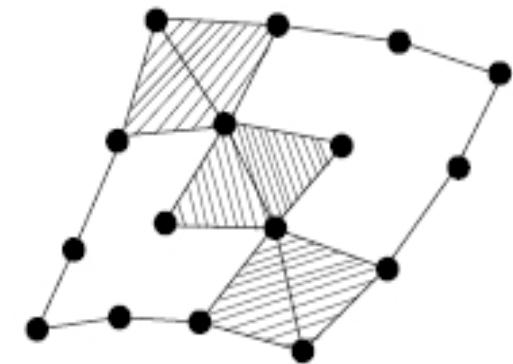

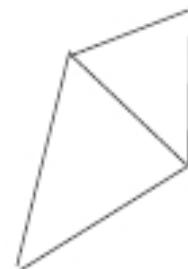

Continuity

C¹ Continuity:

- We need C⁰ continuity.

In addition:

- Points at hatched quadrilaterals are coplanar
- Hatched quadrilaterals are an affine image of the same parameter quadrilateral

Curves on Surfaces, trimmed NURBS

Quad patch problem:

- All of our shapes are parameterized over rectangular or triangular regions
- General boundary curves are hard to create
- Topology fixed to a disc (or cylinder, torus)
- No holes in the middle
- Assembling complicated shapes is painful
 - Lots of pieces
 - Continuity conditions for assembling pieces become complicated
 - Cannot use C^2 B-Splines continuity along boundaries when using multiple pieces

Curves on Surfaces, trimmed NURBS

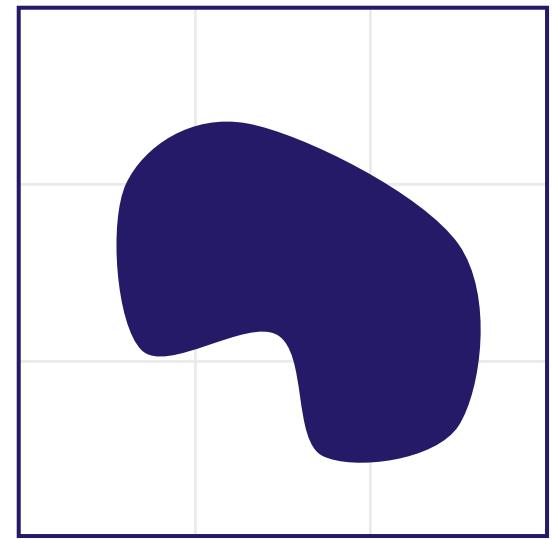

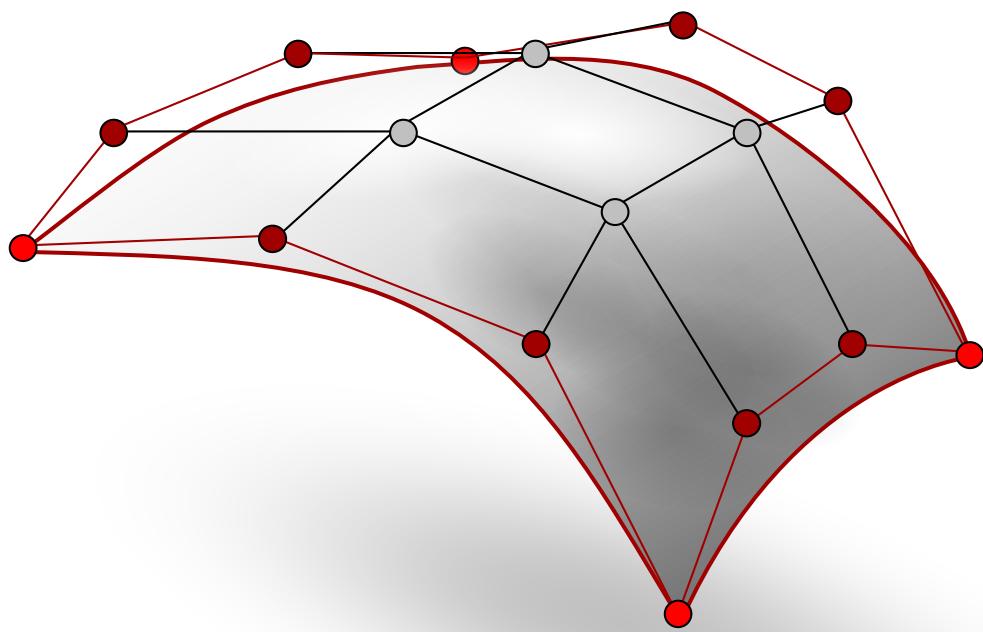

Consequence:

- We need more control over the parameter domain
- One solution is *trimming* using *curves on surfaces (CONS)*
- Standard tool in CAD: *trimmed NURBS*

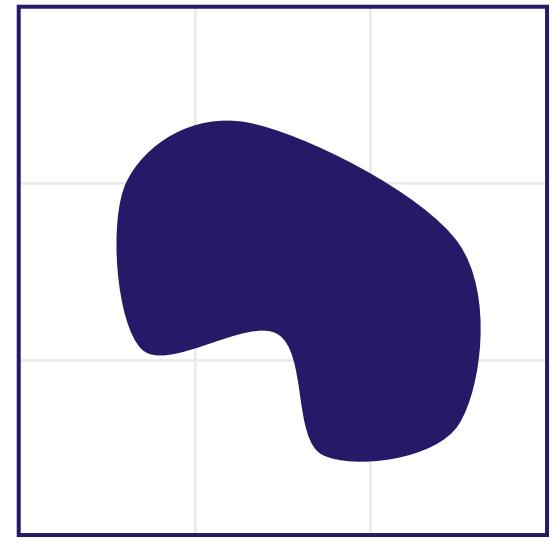

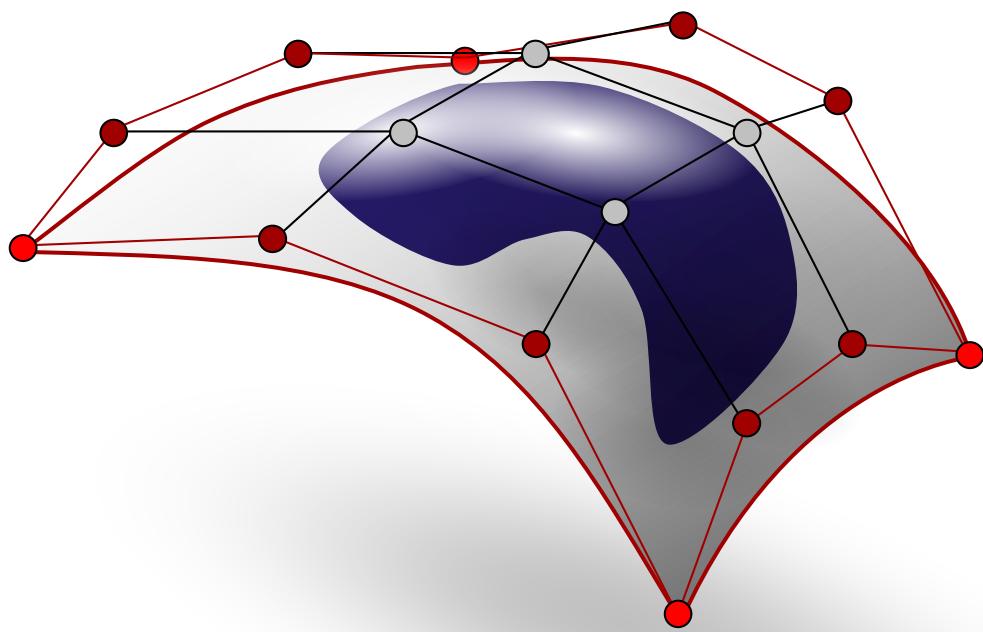

Basic idea:

- Specify a curve in the parameter domain that encapsulates one (or more) pieces of area
- Tessellate the parameter domain accordingly to cut out the trimmed piece (rendering)

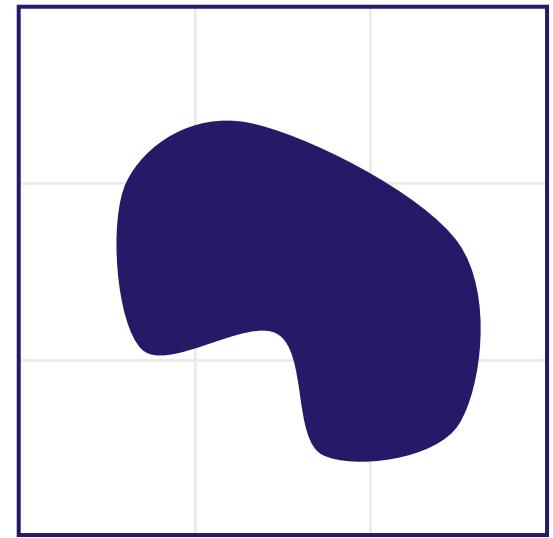

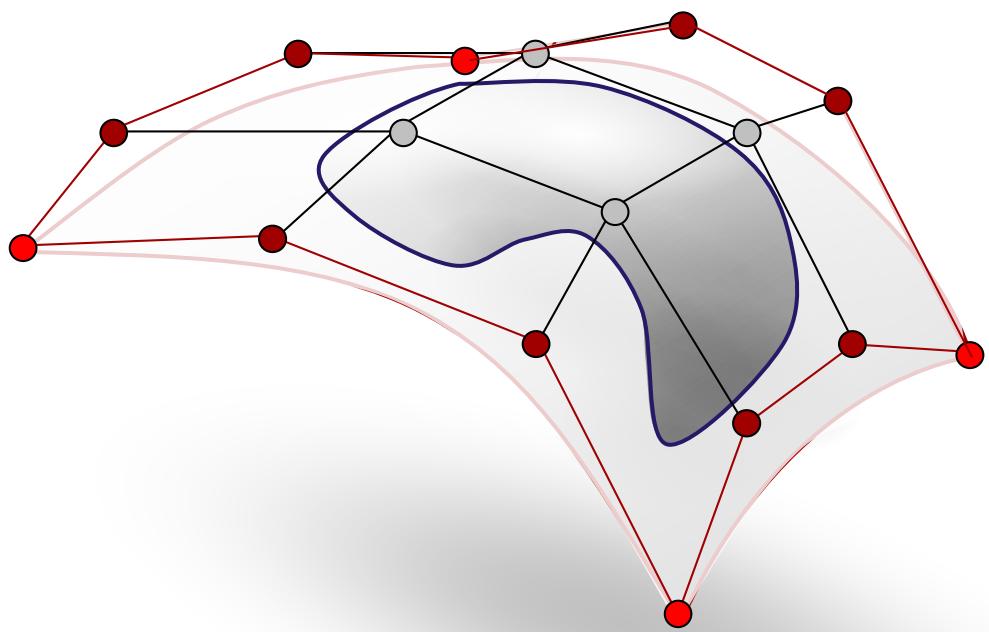

Curves-on-Surfaces (CONS)

Curves-on-Surfaces (CONS)

Curves-on-Surfaces (CONS)

Summary

- **Bezier Curves**
 - de Casteljau algorithm
 - Bernstein form
- **Bezier Splines**
- **Bezier Tensor Product Surfaces**
- **Bezier Total Degree Surfaces**

Subdivision Surfaces

Introduction

Subdivision Surfaces

Problems with Spline Patches:

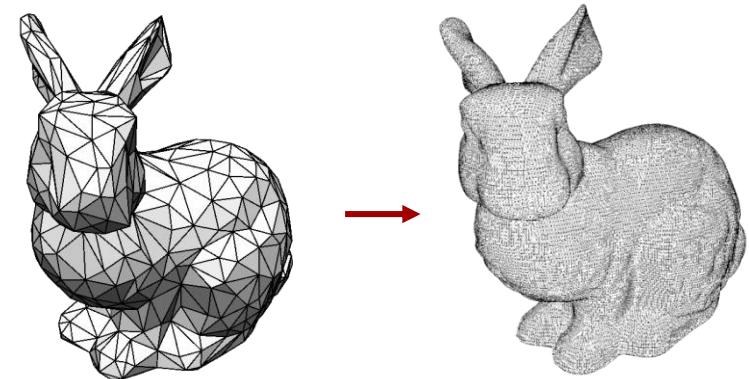

- A continuous tensor product spline surface is only defined on a regular grid of quads as parametrization domain
- Thus, the topology of the object is restricted
- Assembling multiple parameter domains to a single surface is tedious, hard to get continuity guarantees
- Handling trimming curves is not that straightforward

Question: Can we do better?

Subdivision Surfaces

Simple Idea:

- Use a triangle mesh / quad mesh itself as a parametrization domain (“base mesh”)
- Use 1:4 splits to refine the base mesh (subdivision connectivity meshes)
- Find an interpolation rule to create a smooth surface

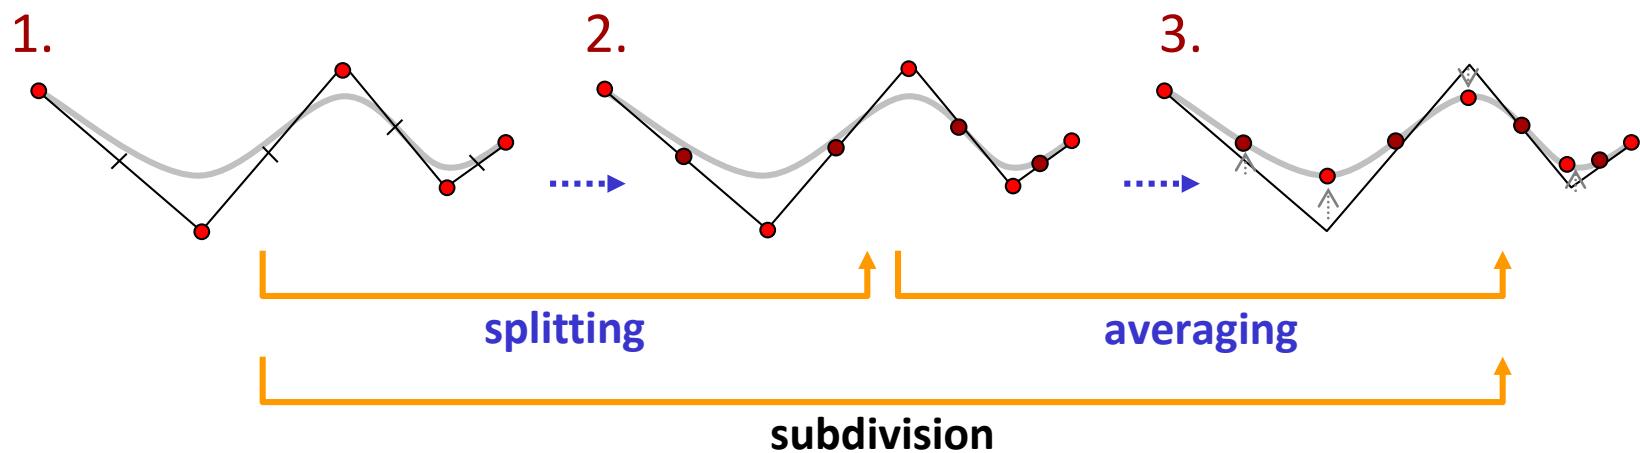

This basic idea leads to subdivision surfaces.

Basic Scheme

Subdivision Curves & Surface: Three Steps

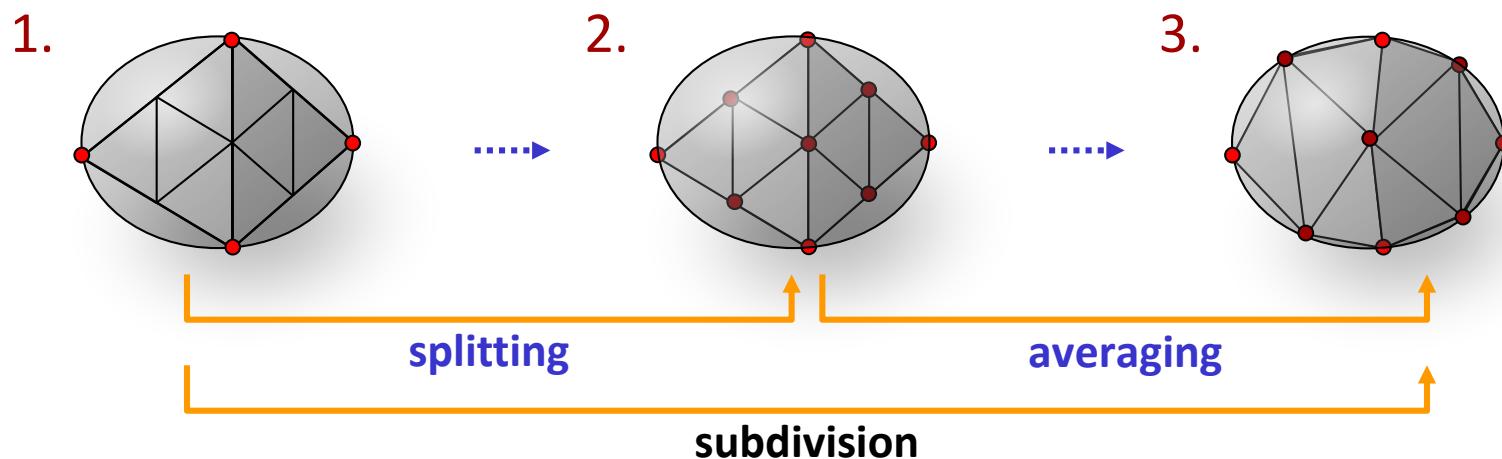

1. Subdivide current mesh
2. Insert linearly interpolated points (*splitting*)
3. Move points: Local weighted average (*averaging*)
 - To all points – approximating scheme
 - To new points only – interpolating scheme

Basic Scheme

Subdivision Curves & Surface: Three Steps

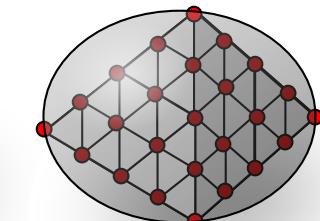

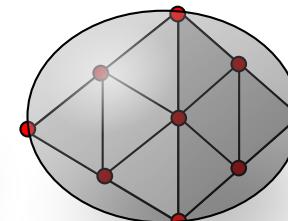

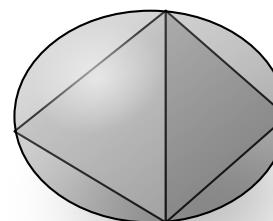

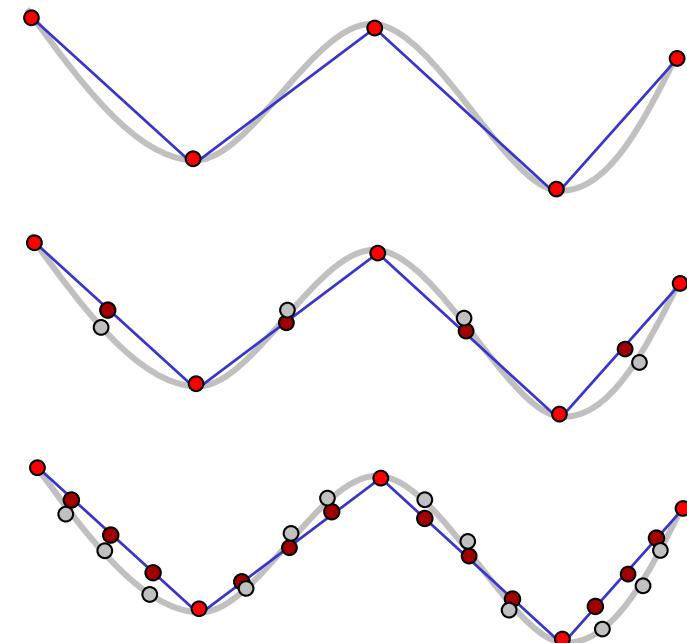

1. Subdivide current mesh
2. Insert linearly interpolated points (*splitting*)
3. Move points: Local weighted average (*averaging*)
 - To all points – approximating scheme
 - To new points only – interpolating scheme

Subdivision Surfaces

The main question is:

- How should we place the new points to create a smooth surface? (interpolating scheme)
- Respectively: How should we alter the points in each subdivision step to create a smooth surface? (approximating scheme)

Subdivision Schemes

More precisely:

- What are good *averaging masks*?
- The averaging mask determines the weights by which the new point positions are computed

Interesting observation:

- Most averaging schemes do not converge
(in particular interpolating schemes – try this at home).
- We need to be very careful to design a good averaging mask.
- How can we guarantee C^1 , C^2 surfaces?

Subdivision surfaces – History

de Rahm described a 2D (curve) subdivision scheme in 1947; rediscovered in 1974 by Chaikin

Concept extended to 3D (surface) schemes by two separate groups during 1978:

- Doo and Sabin found a biquadratic surface
- Catmull and Clark found a bicubic surface

Subsequent work in the 1980s (Loop, 1987; Dyn [Butterfly subdivision], 1990) led to tools suitable for CAD/CAM and animation

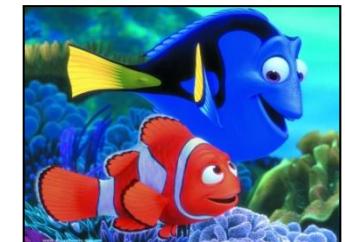

Subdivision surfaces and the movies

Pixar first demonstrated subdivision surfaces in 1997 with Geri's Game.

- Up until then they'd done everything in NURBS (Toy Story, A Bug's Life.)
- From 1999 onwards everything they did was with subdivision surfaces (Toy Story 2, Monsters Inc, Finding Nemo...)

It's not clear what Dreamworks uses, but they have recent patents on subdivision techniques.

Video about Subdivision Surfaces

<http://youtu.be/ckOTI2GcS-E>

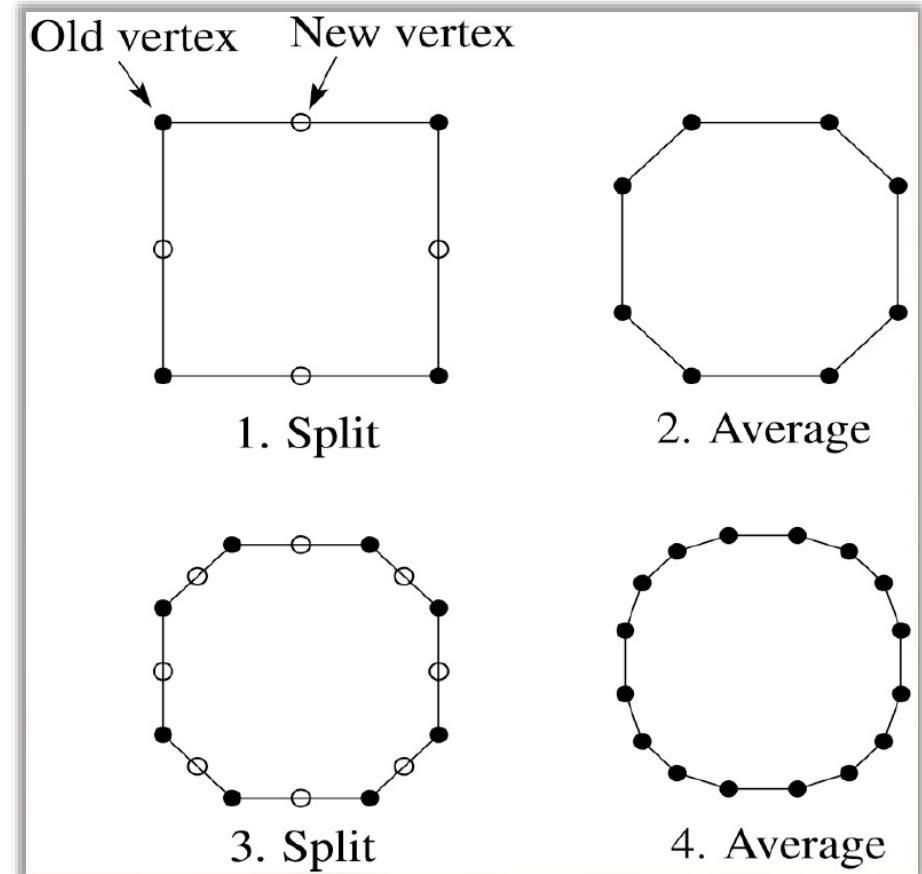

Example: Corner Cutting

very important

Corner Cutting Splines

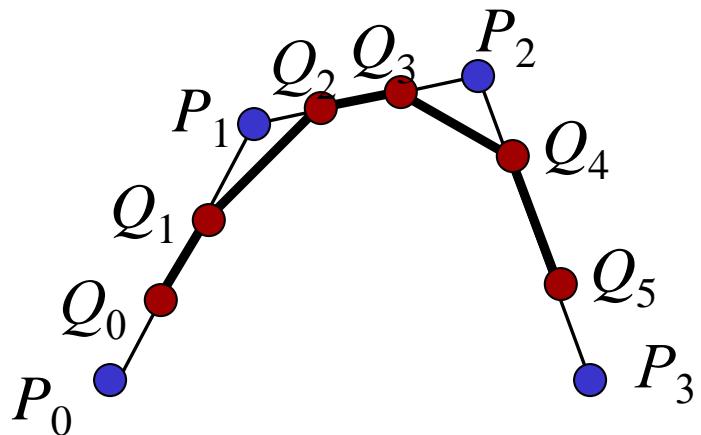

[Chaikin 1974]:

1. Split each line segment in half.
 2. Average every point with its next neighbor (clock-wise).
 3. Repeat.
- Converges to quadratic B-Spline curve

a different view on the same algorithm...

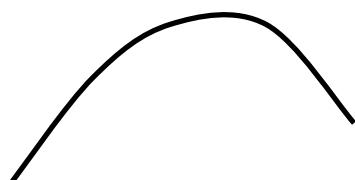

Chaikin's Corner Cutting

Apply
Iterated
Function
System

$Q_{2i} = \frac{3}{4}P_i + \frac{1}{4}P_{i+1}$

$$Q_{2i+1} = \frac{1}{4}P_i + \frac{3}{4}P_{i+1}$$

Limit Curve Surface

$$Q_0 = \frac{3}{4}P_0 + \frac{1}{4}P_1$$

$$Q_1 = \frac{1}{4}P_0 + \frac{3}{4}P_1$$

$$Q_2 = \frac{3}{4}P_1 + \frac{1}{4}P_2$$

$$Q_3 = \frac{1}{4}P_1 + \frac{3}{4}P_2$$

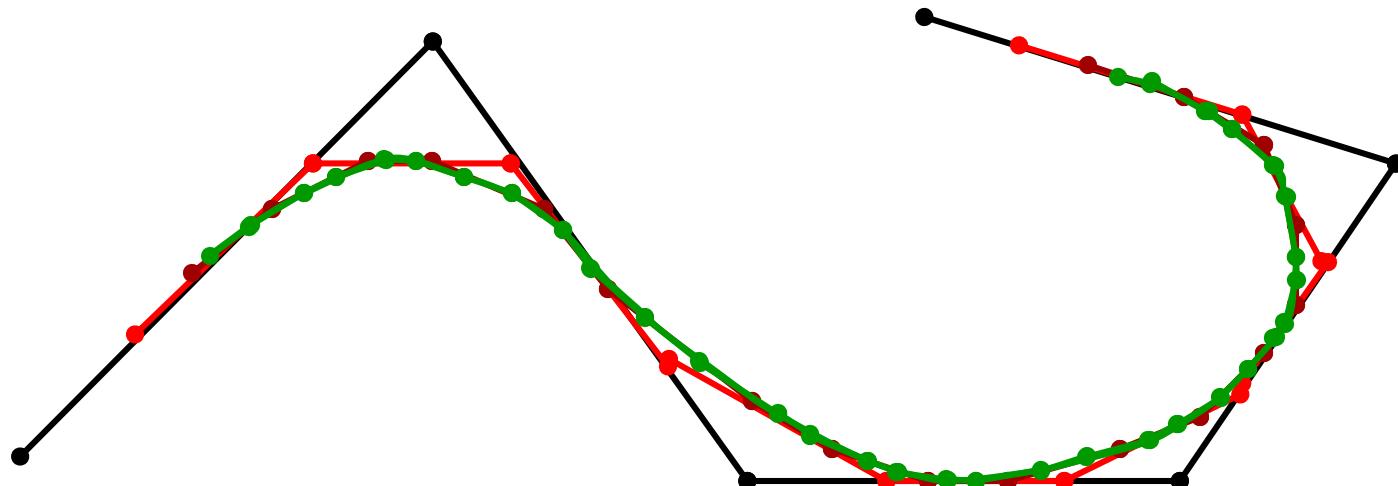

$$Q_4 = \frac{3}{4}P_2 + \frac{1}{4}P_3$$

$$Q_5 = \frac{1}{4}P_2 + \frac{3}{4}P_3$$

Chaikin's Corner Cutting

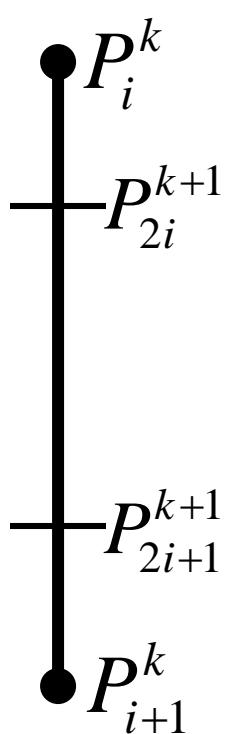

Chaikin curve subdivision (2D)

- On each edge, insert new control points at $\frac{1}{4}$ and $\frac{3}{4}$ between old vertices; delete the old points
- The *limit curve* is C1 everywhere

Chaikin's Corner Cutting

Chaikin can be written programmatically as:

$$P_{2i}^{k+1} = \left(\frac{3}{4}\right)P_i^k + \left(\frac{1}{4}\right)P_{i+1}^k \quad \leftarrow Even$$

$$P_{2i+1}^{k+1} = \left(\frac{1}{4}\right)P_i^k + \left(\frac{3}{4}\right)P_{i+1}^k \quad \leftarrow Odd$$

- ...where k is the ‘generation’; each generation will have twice as many control points as before.
- Notice the different treatment of generating odd and even control points.
- Borders (terminal points) are a special case.

Chaikin's Corner Cutting

Chaikin can be written in vector notation as:

$$\begin{bmatrix} M \\ P_{2i-2}^{k+1} \\ P_{2i-1}^{k+1} \\ P_{2i}^{k+1} \\ P_{2i+1}^{k+1} \\ P_{2i+2}^{k+1} \\ P_{2i+3}^{k+1} \\ M \end{bmatrix} = \frac{1}{4} \begin{bmatrix} O \\ 0 & 3 & 1 & 0 & 0 & 0 \\ 0 & 1 & 3 & 0 & 0 & 0 \\ 0 & 0 & 3 & 1 & 0 & 0 \\ 0 & 0 & 1 & 3 & 0 & 0 \\ 0 & 0 & 0 & 3 & 1 & 0 \\ 0 & 0 & 0 & 1 & 3 & 0 \\ O & M \end{bmatrix} \begin{bmatrix} N \\ P_{i-2}^k \\ P_{i-1}^k \\ P_i^k \\ P_{i+1}^k \\ P_{i+2}^k \\ P_{i+3}^k \\ M \end{bmatrix}$$

Chaikin's Corner Cutting

The standard notation compresses the scheme to a *kernel*:

- $h = (1/4)[..., 0, 0, 1, 3, 3, 1, 0, 0, ...]$

The kernel interlaces the odd and even rules.

It also makes matrix analysis possible: eigenanalysis of the matrix form can be used to prove the continuity of the subdivision limit limit surface.

The limit curve of Chaikin is a quadratic B-spline!

Cubic B-Spline Subdivision Scheme

Cubic Subdivision

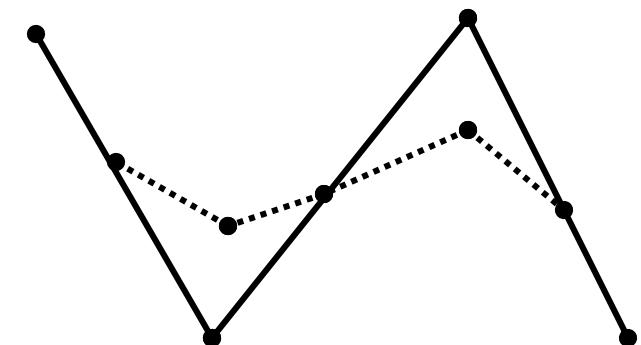

Consider the kernel

- $h=(1/8)[...,0,0,1,4,6,4,1,0,0,...]$

You would read this as

$$P_{2i}^{k+1} = (\textstyle\frac{1}{8})(P_{i-1}^k + 6P_i^k + P_{i+1}^k)$$

$$P_{2i+1}^{k+1} = (\textstyle\frac{1}{8})(4P_i^k + 4P_{i+1}^k)$$

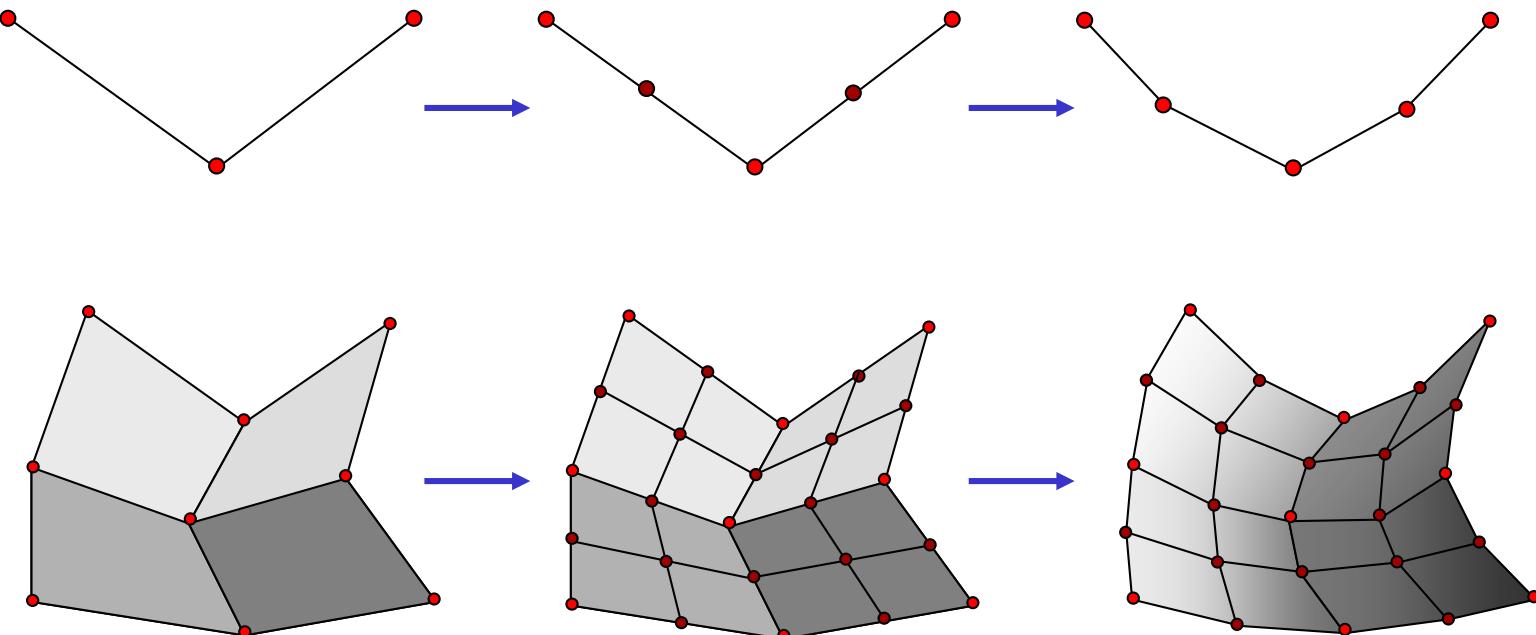

The limit curve is provably C2-continuous.

B-Spline Subdivision Surfaces

B-Spline Subdivision Surfaces

B-Spline Subdivision Surfaces

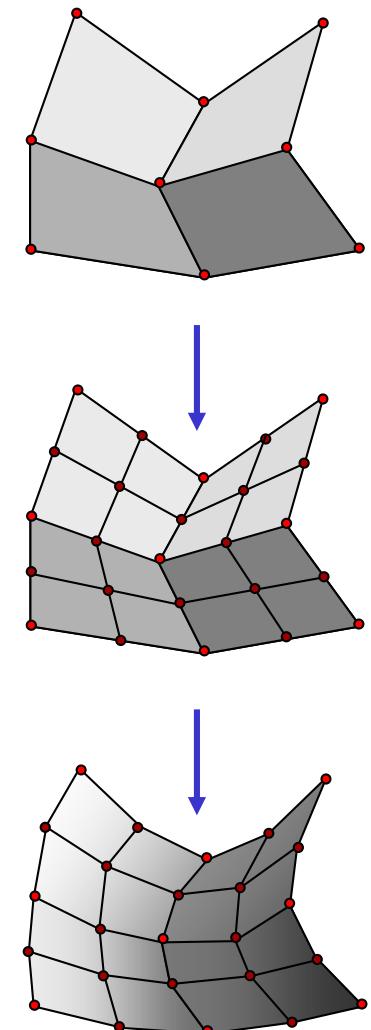

- We can apply the tensor product construction to obtain subdivision surfaces:

B-Spline Subdivision Surfaces

Tensor Product B-Spline Subdivision Surfaces:

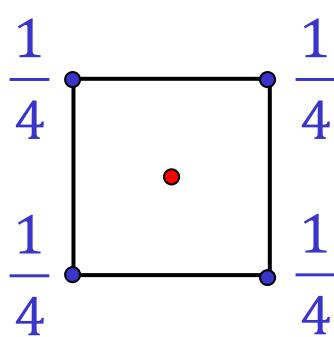

- Start with a regular quad mesh (will be relaxed later)
- In each subdivision step:
 - Divide each quad in four (quadtree subdivision)
 - Place linearly interpolated vertices
 - Apply 2-dimensional averaging mask

Subdivision and Averaging Masks

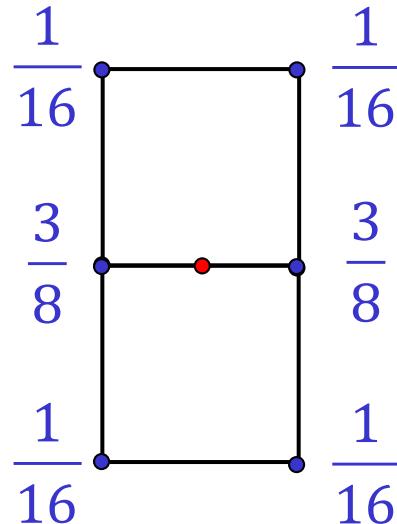

What is the subdivision mask?

- Can be derived from tensor product construction:

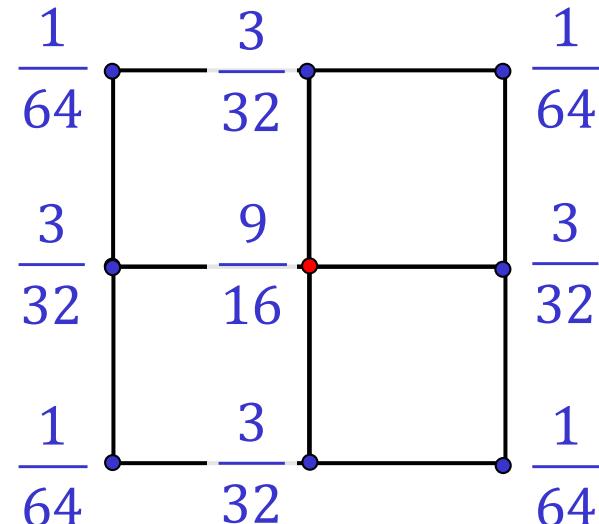

face midpoint
(odd/odd)

$$\begin{pmatrix} \frac{1}{2} \\ \frac{1}{2} \end{pmatrix} \cdot \begin{bmatrix} \frac{1}{2}, \frac{1}{2} \end{bmatrix}$$

edge midpoint
(even/odd)

$$\begin{pmatrix} \frac{1}{2} \\ \frac{1}{2} \\ \frac{1}{2} \end{pmatrix} \cdot \begin{bmatrix} \frac{1}{8}, \frac{3}{4}, \frac{1}{8} \end{bmatrix}$$

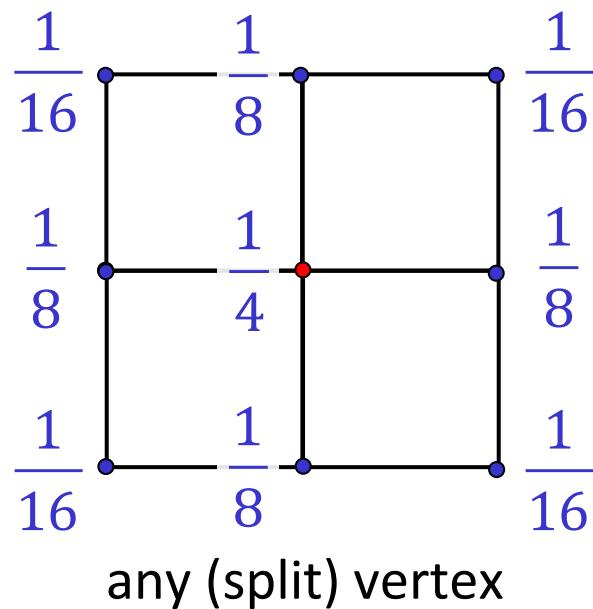

original vertex
(even/even)

$$\begin{pmatrix} \frac{1}{8} \\ \frac{3}{4} \\ \frac{1}{8} \end{pmatrix} \cdot \begin{bmatrix} \frac{1}{8}, \frac{3}{4}, \frac{1}{8} \end{bmatrix}$$

Subdivision and Averaging Masks

What is the averaging mask?

- Can be derived from tensor product construction, too:

$$\begin{pmatrix} \frac{1}{4} \\ \frac{1}{2} \\ \frac{1}{4} \end{pmatrix} \cdot \left[\frac{1}{4}, \frac{1}{2}, \frac{1}{4} \right]$$

Generalizations

Generalizations:

- General degree B-spline tensor product surface subdivision rules can be derived in the same way
- Just use the 1-dimensional subdivision / averaging masks and form a tensor product mask
- Guaranteed to converge to a C^{d-1} -smooth surface
- Extraordinary vertices need to be treated properly:
 - Catmull-Clark subdivision scheme, and others

Introduction to Visualization and Computer Graphics

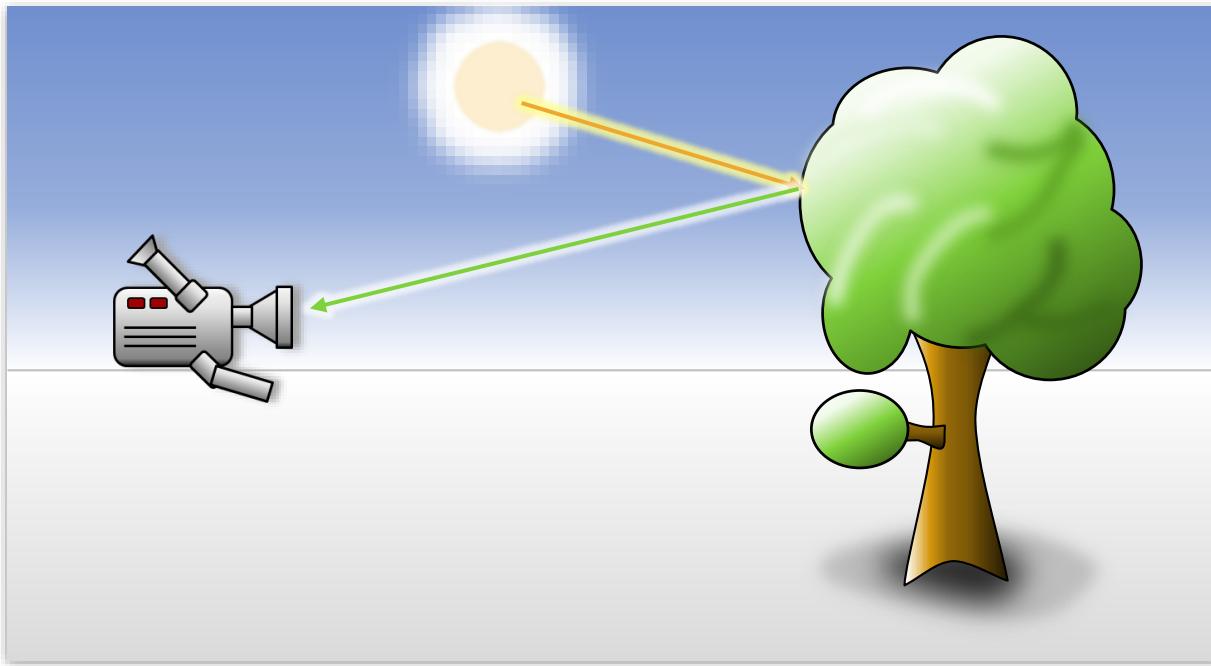

DH2320

Prof. Dr. Tino Weinkauf

Color

Physics, Biology
Ray Optics & Color

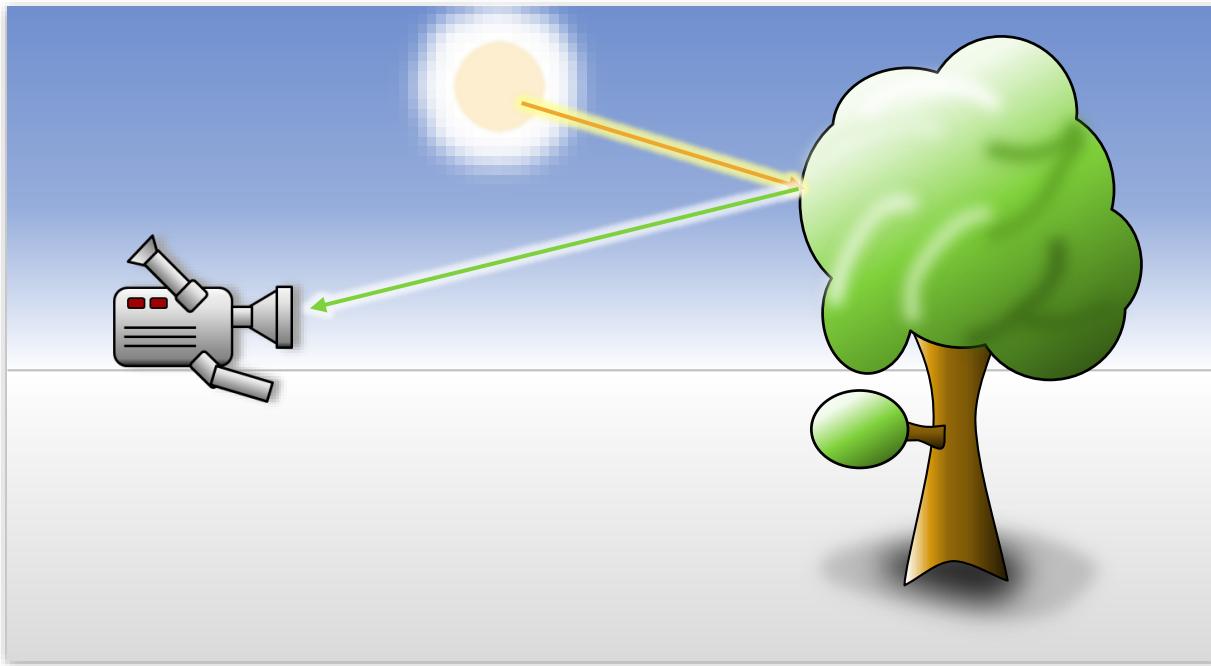

Ray Optics

Geometric ray model

- Light travels along rays

Ray Optics

Geometric ray model

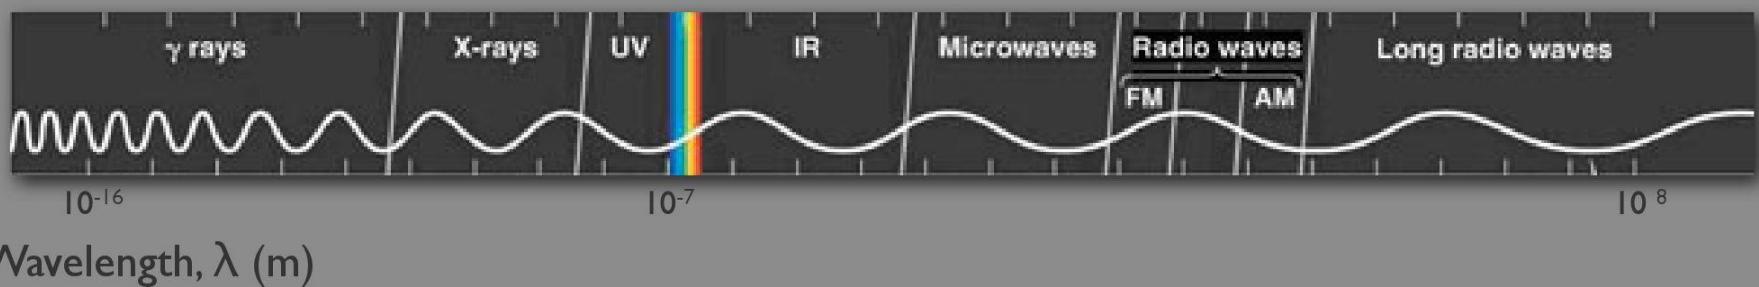

- Rays have “intensity” and “color”

What is COLOR?

- Next slides mostly from Kristi Potter (U Utah)

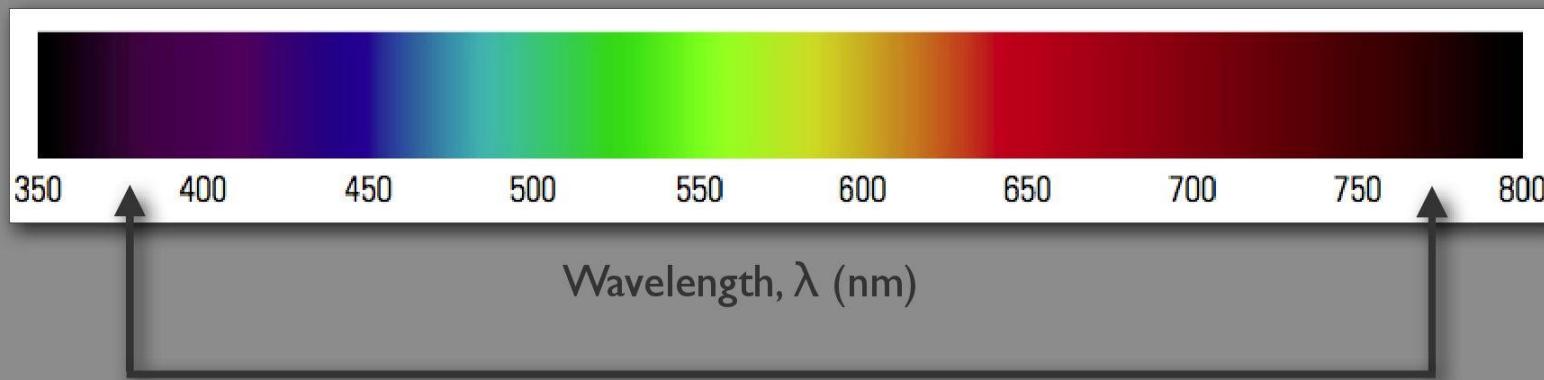

The Electromagnetic Spectrum

Range of all possible frequencies of electromagnetic radiation

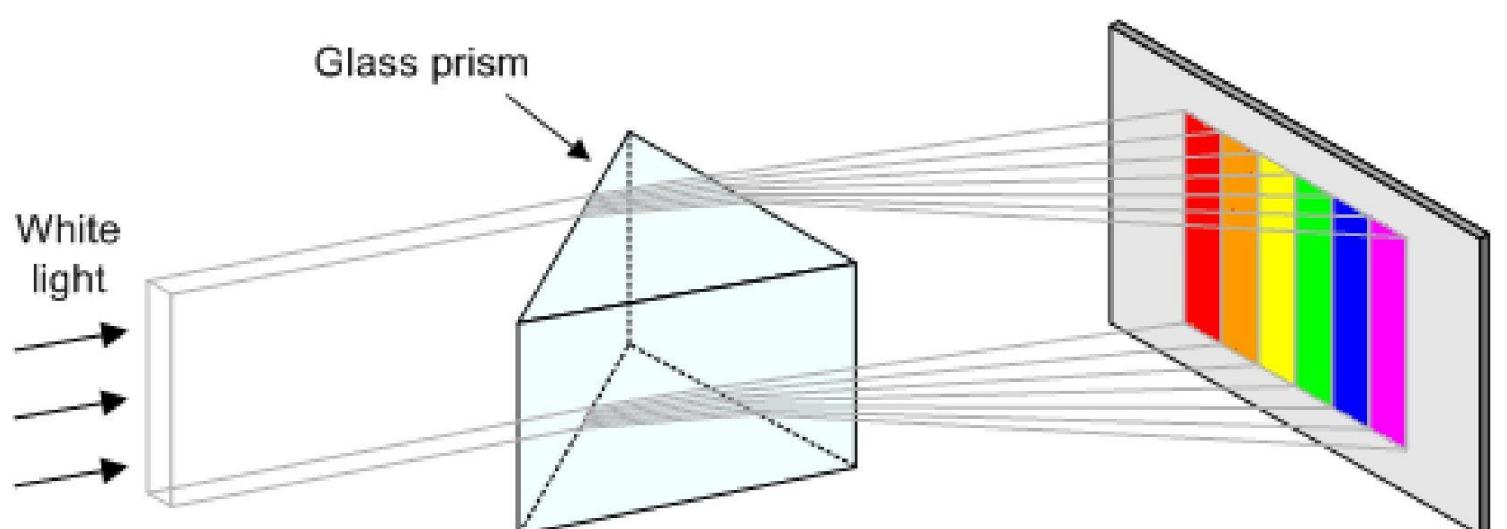

The Visible Spectrum

Human Visual System Sensitive to 380-780 nm

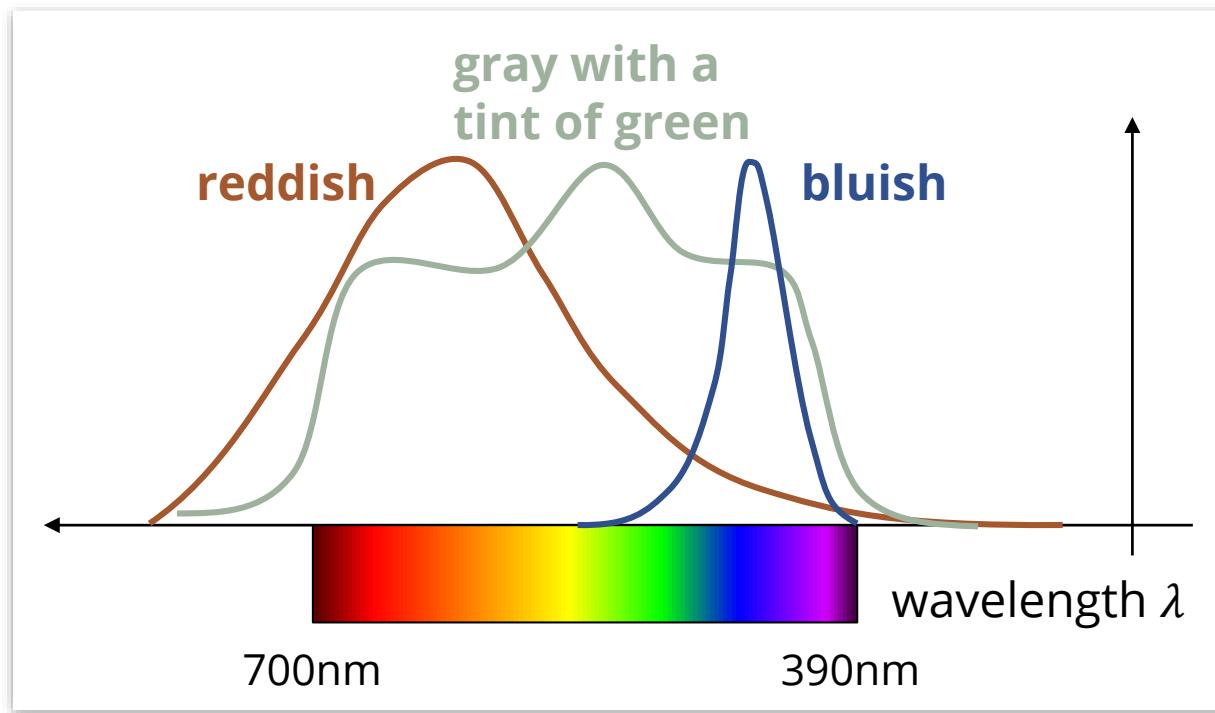

Isaac Newton

Objects appear colored by the character of the light they reflect

Newton's experiment for splitting white light into a spectrum

Ray Optics

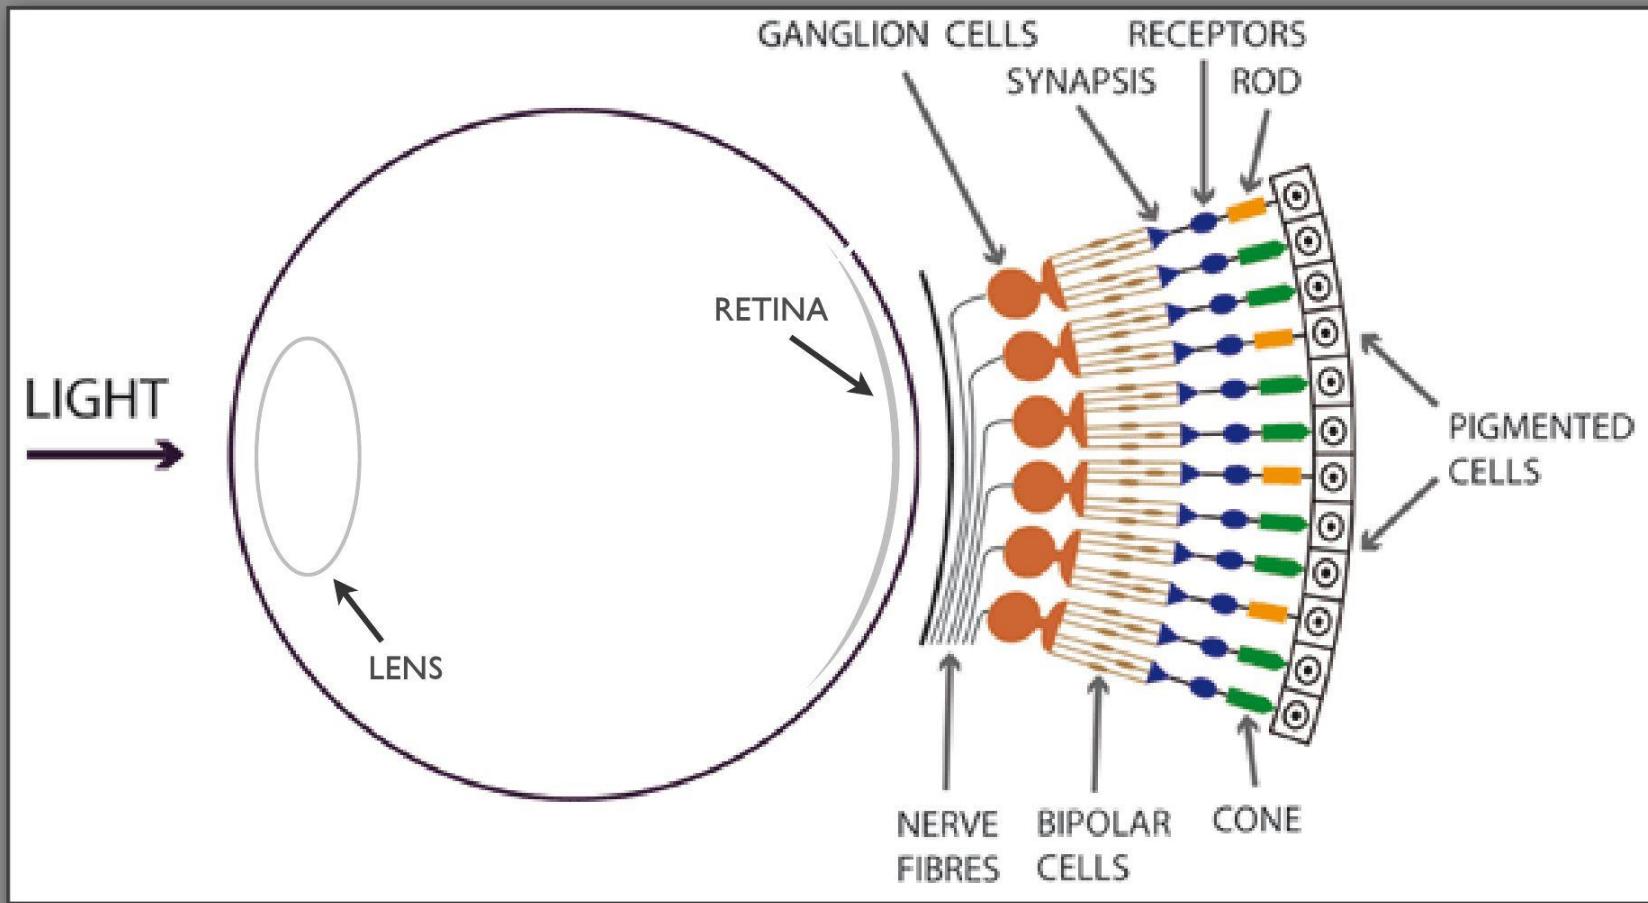

Color spectrum

- Continuous spectrum
- Intensity for each wavelength

Human Color Perception

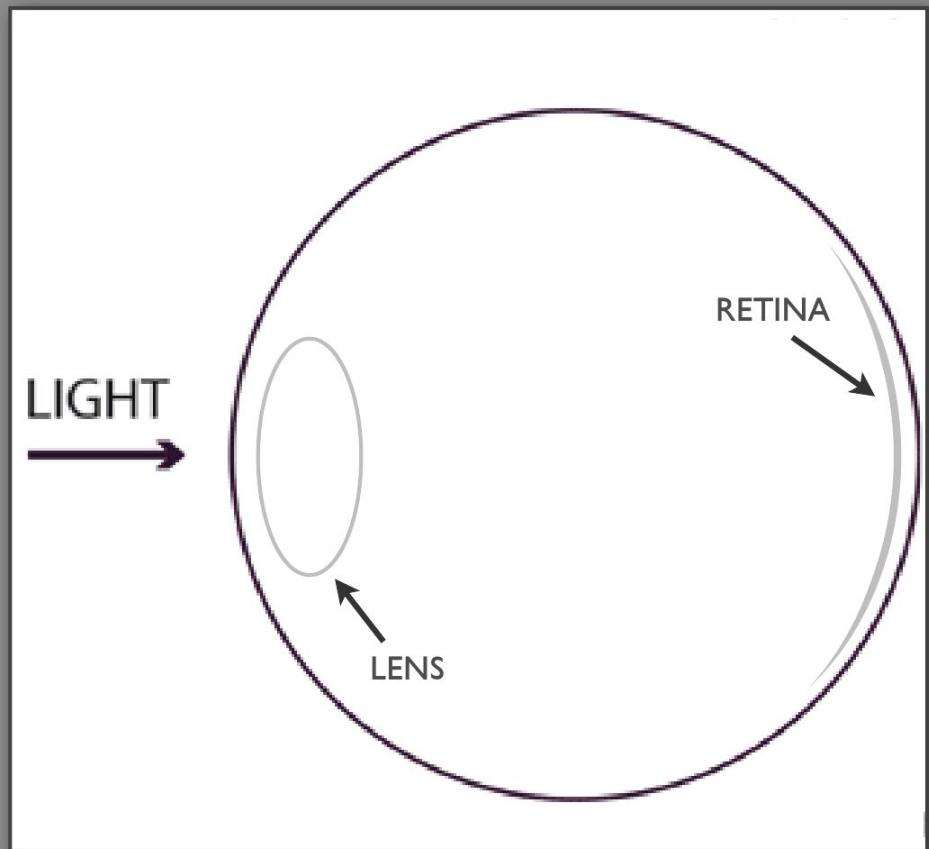

The Eye

Not like a camera

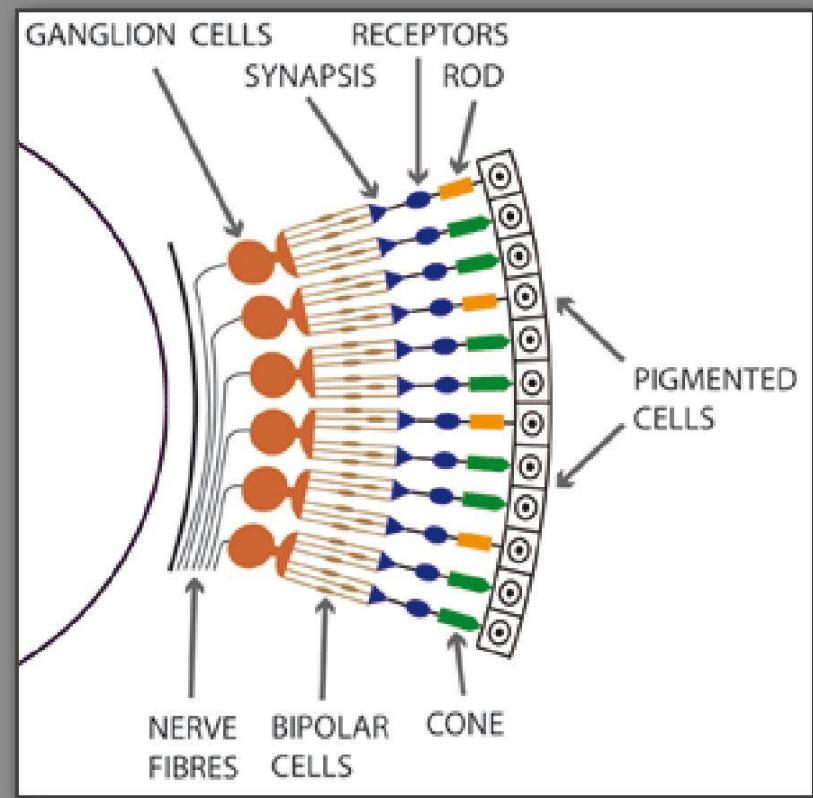

Passage of Light

- Light → Lens
- Lens → Retina

Retina

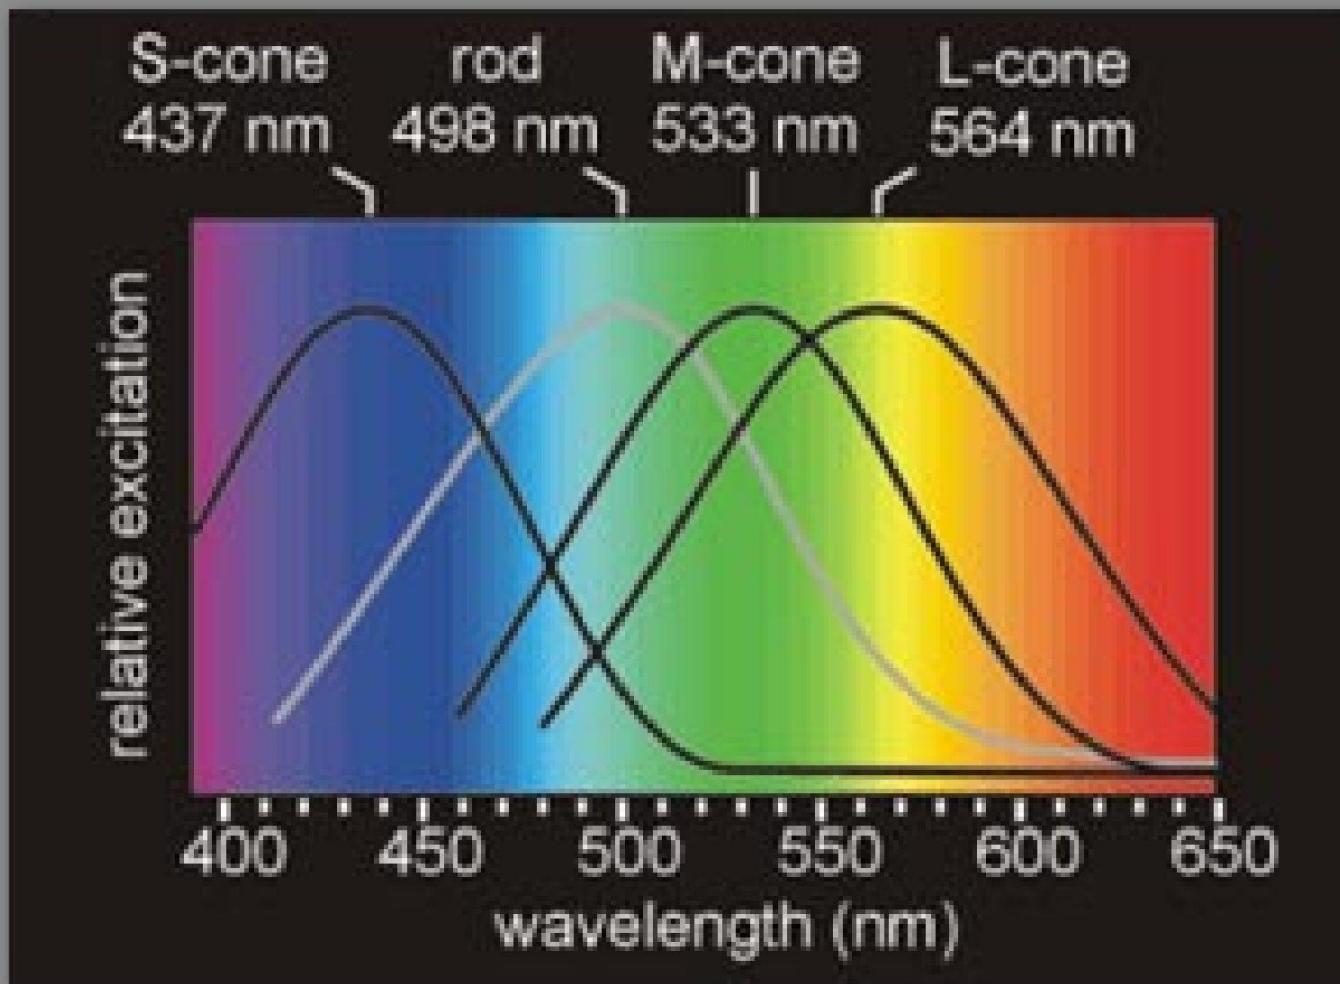

- Optimized for acuity
(rather than light sensitivity)
- Initiate information extraction
- Pigmented cells absorb light

Photoreceptors

- Cones for day vision (small, medium, long)
- Rods for night vision
- Binary signal on/off
- Info indicated by which cell & how often

Color Coded through Signal Comparison

Why 3?

- Our 3 cones cover the visible spectrum
- Theoretically possible with only 2 cones
- Most birds, some fish, reptiles & insects have 4

- Color is:

- A spectral distribution of light
- Perceptual response to spectral distribution of light
- A way of encoding a spectral distribution of light

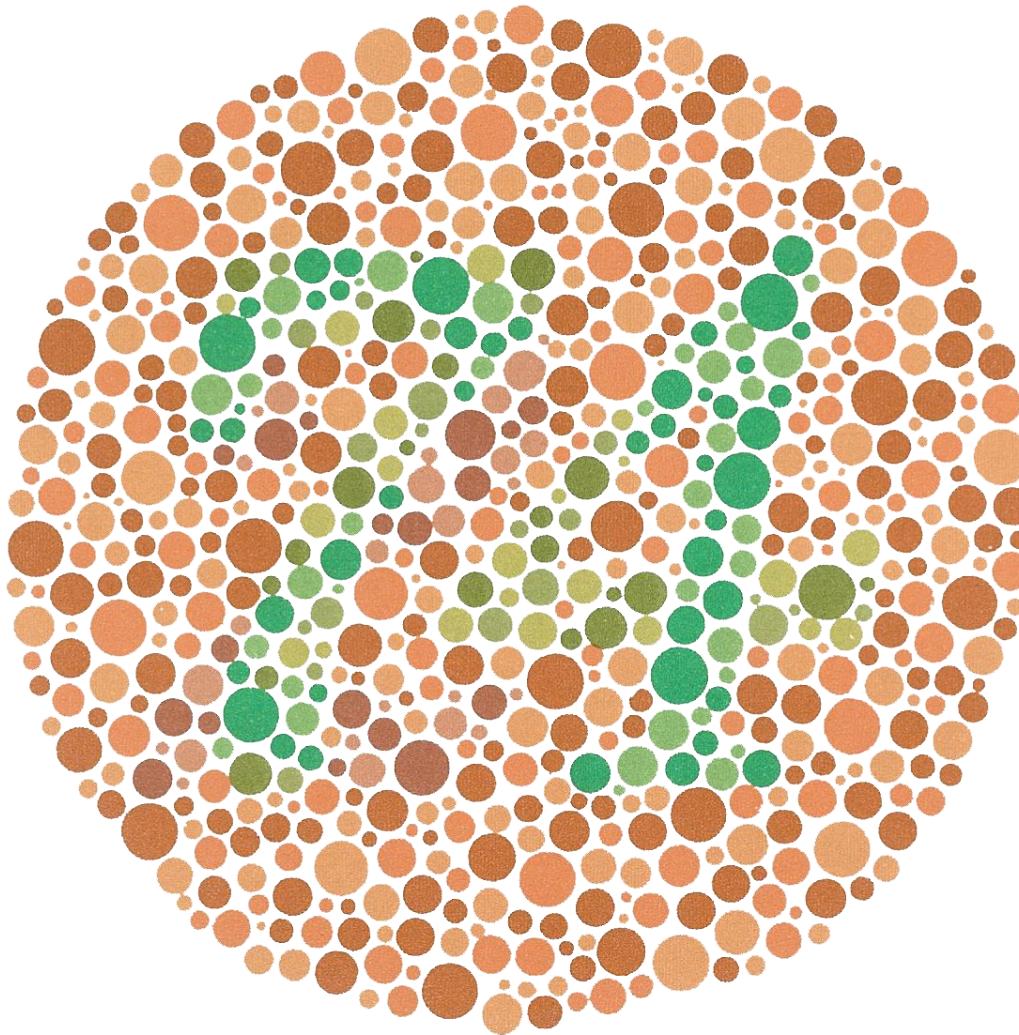

Computer Graphics

Visualization

Vision Science
Neuro Science

- It would be too simplistic to describe color just as
 - A particular wavelength of light
 - RGB

Color Blindness

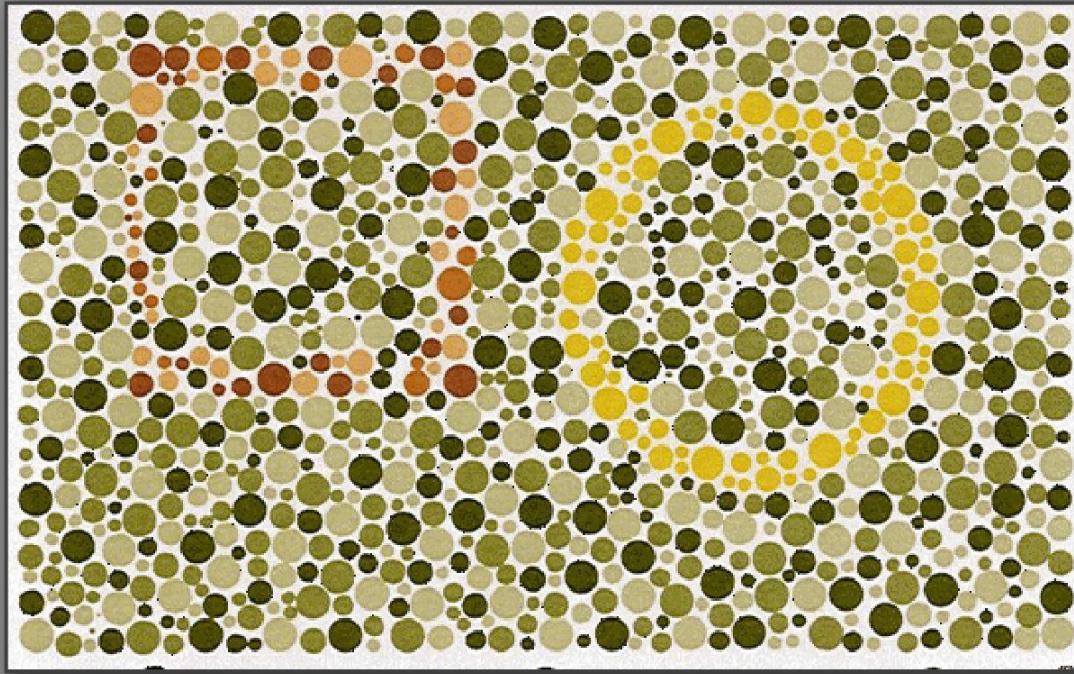

The numeral "74" should be clearly visible to viewers with normal color vision.

Viewers with dichromacy or anomalous trichromacy may read it as "21".

Viewers with achromatopsia may not see numbers.

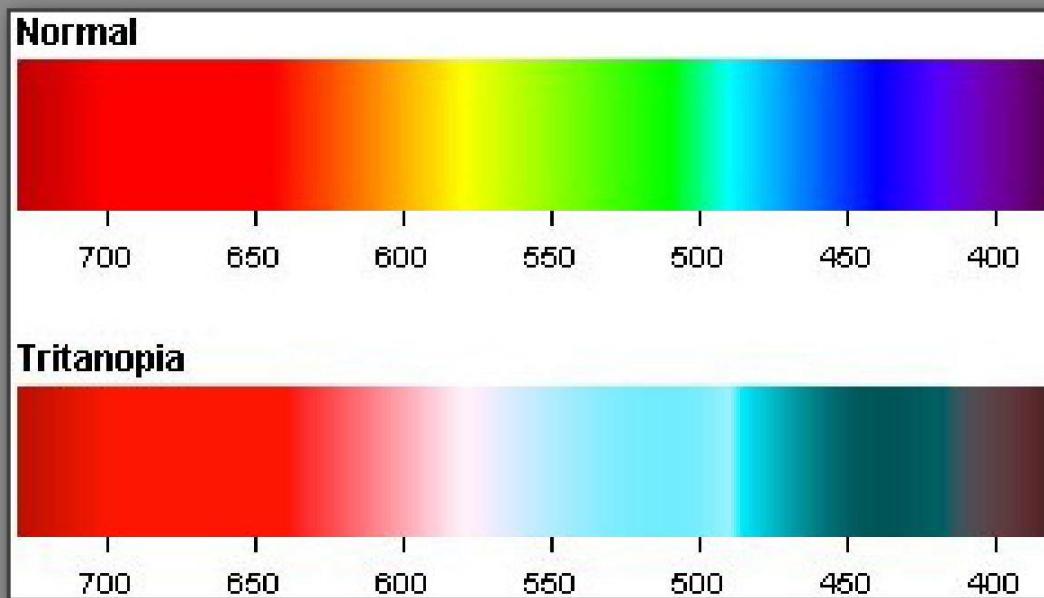

From http://en.wikipedia.org/wiki/Color_blindness

Red/Green

- Lack of or mutations in red or green cones
- Genes located on the X chromosome
(women have 2, men have 1)
- 10% of men, less than 1% of women

Blue/Yellow

- Equally found in men & women
- mutation in short wave cone

THE DIFFERENT APPEARANCES OF THE VISIBLE SPECTRUM

normal

missing long-wavelength cone

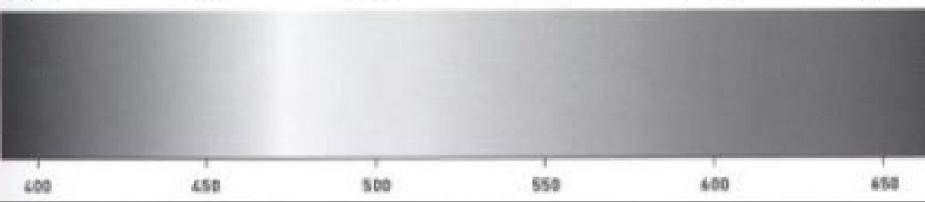

missing middle-wavelength cone

missing short-wavelength cone

missing long & middle cones

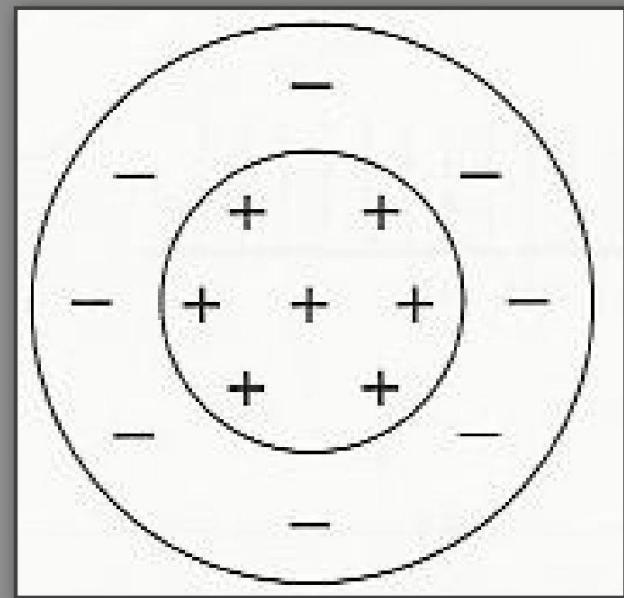

rod vision
(night vision)

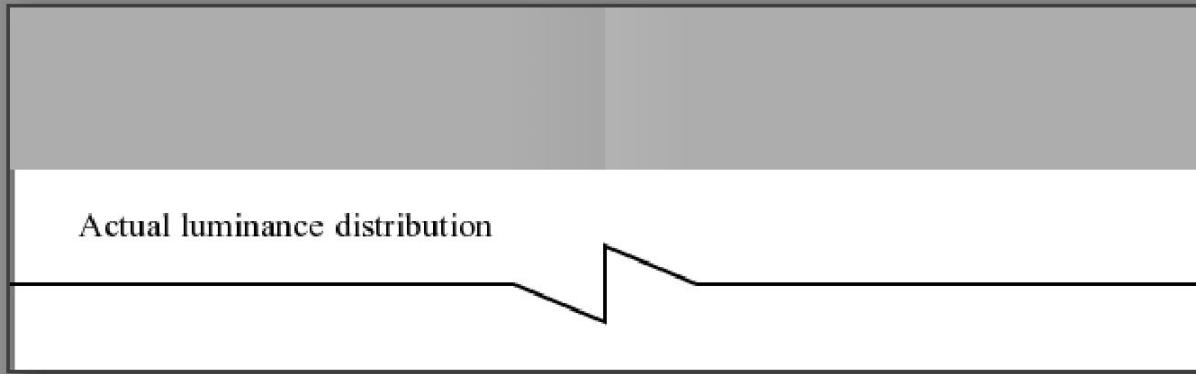

Color Illusions

Center/Surround

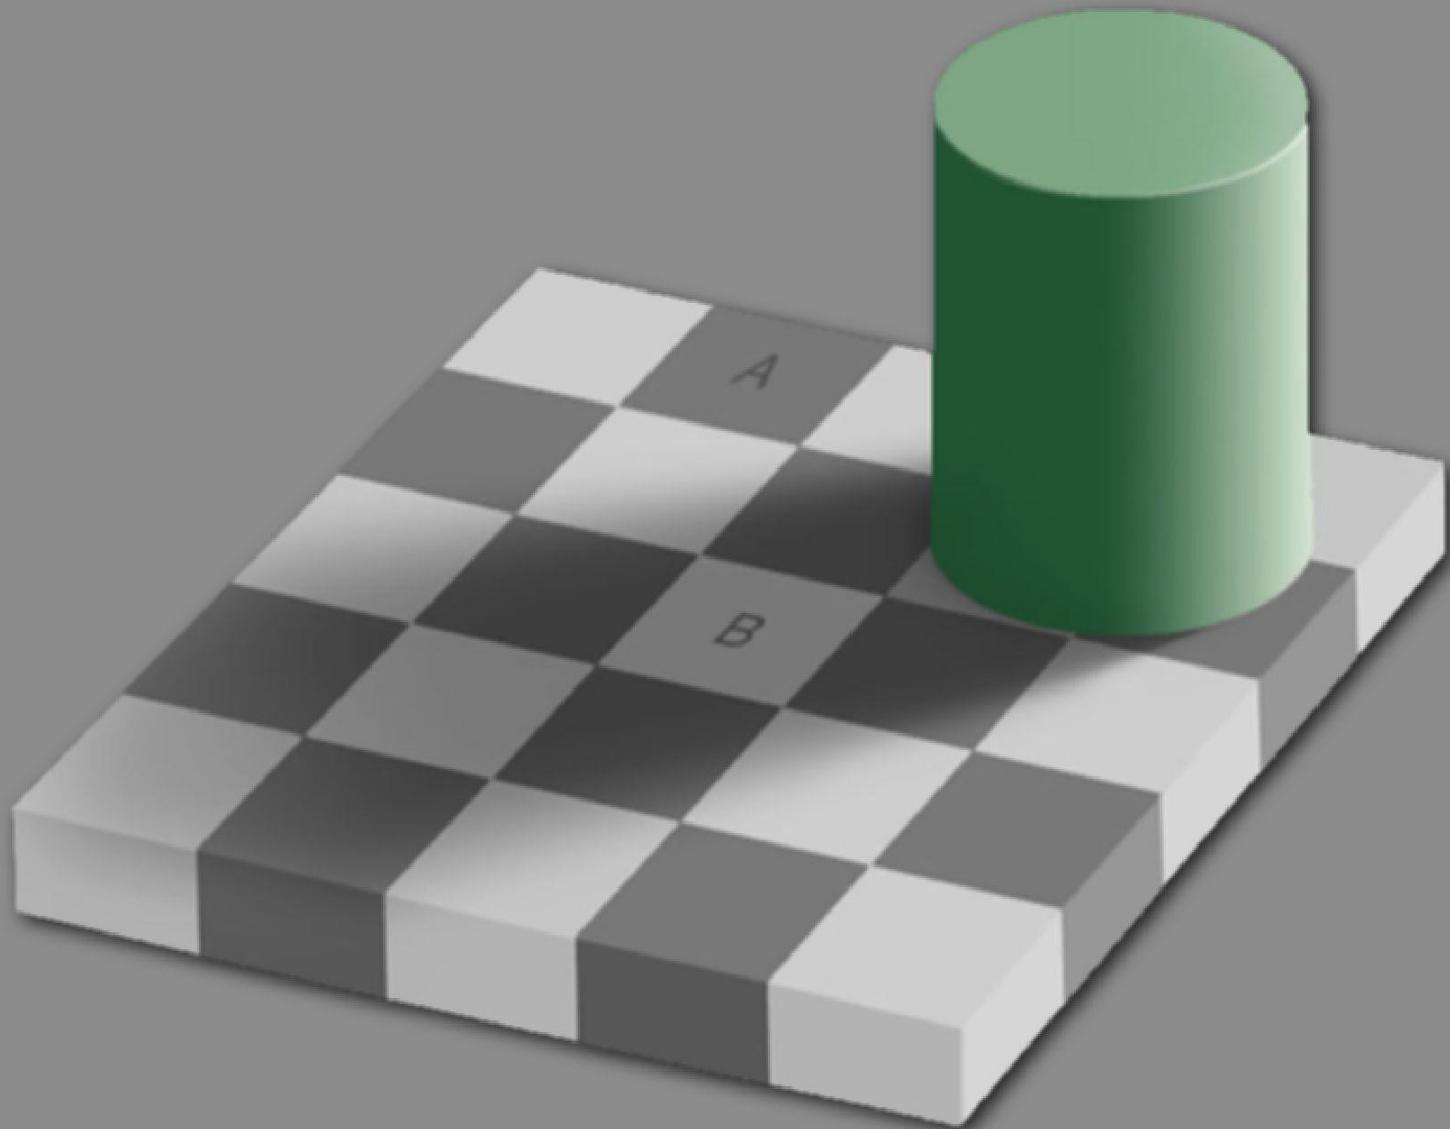

- Retinal ganglion cells
- First stage of visual processing
- Triggered by light in the center suppressed by light in the surround
- Selectively sensitive to discontinuities in light

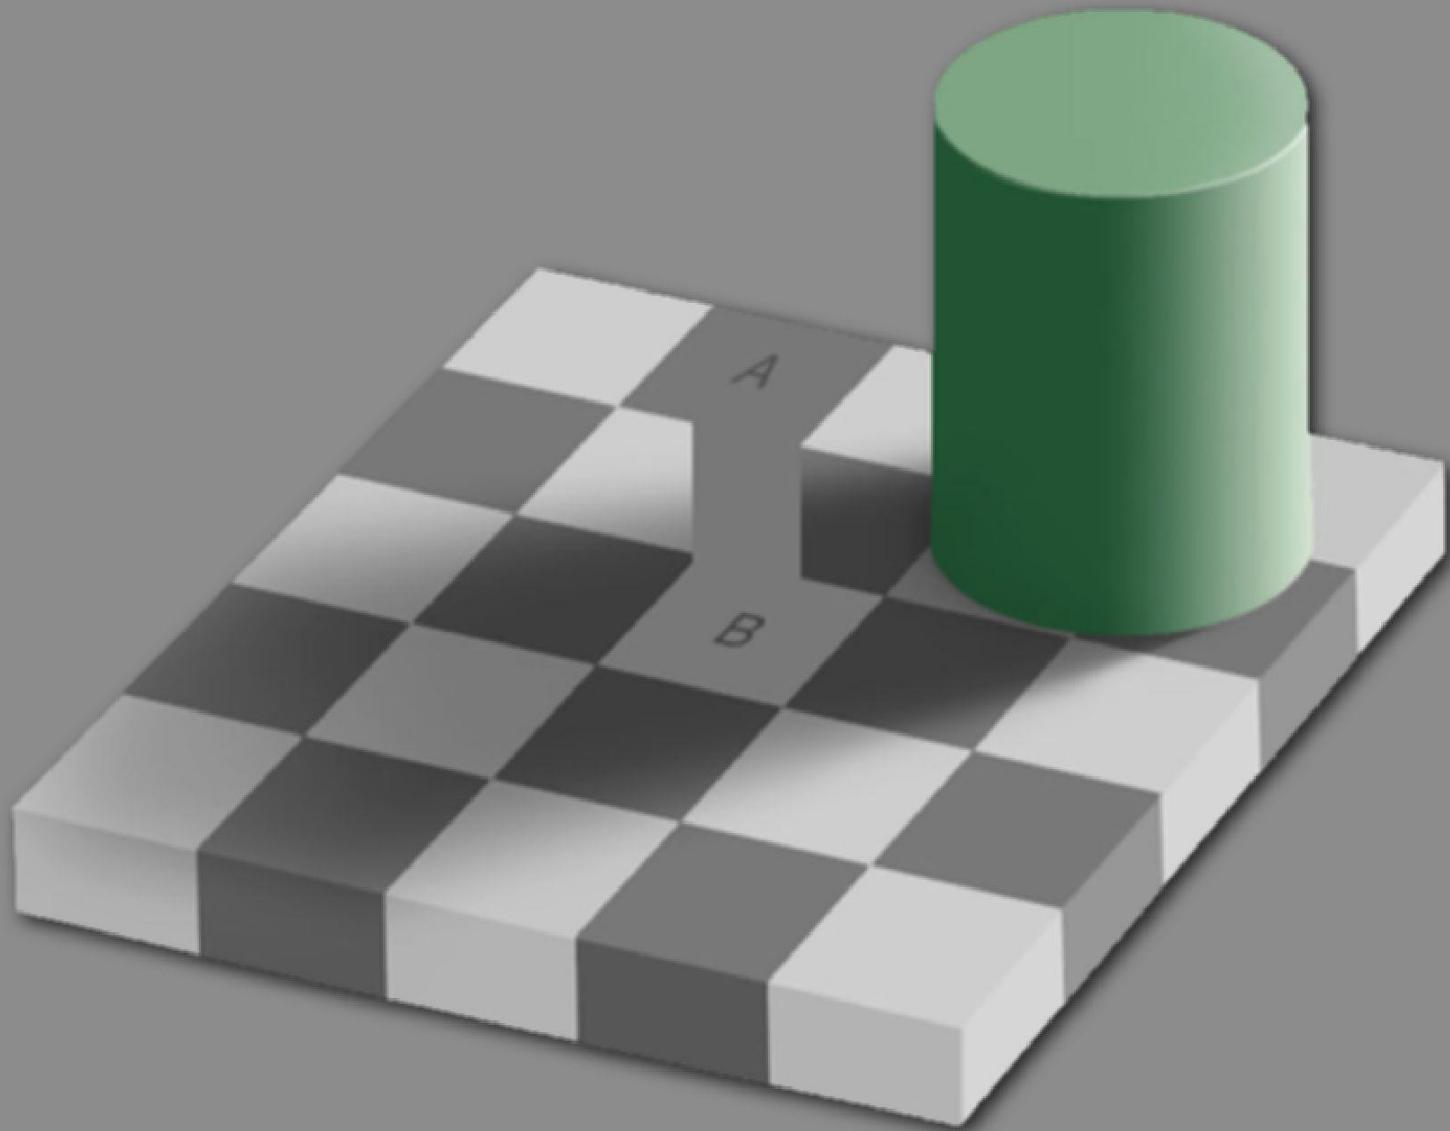

Cornsweet Illusion

- Luminance the same at the ends
- Many perceptions more sensitive to abrupt change (luminance, color, motion, depth)
- Attributed to center/surround organization

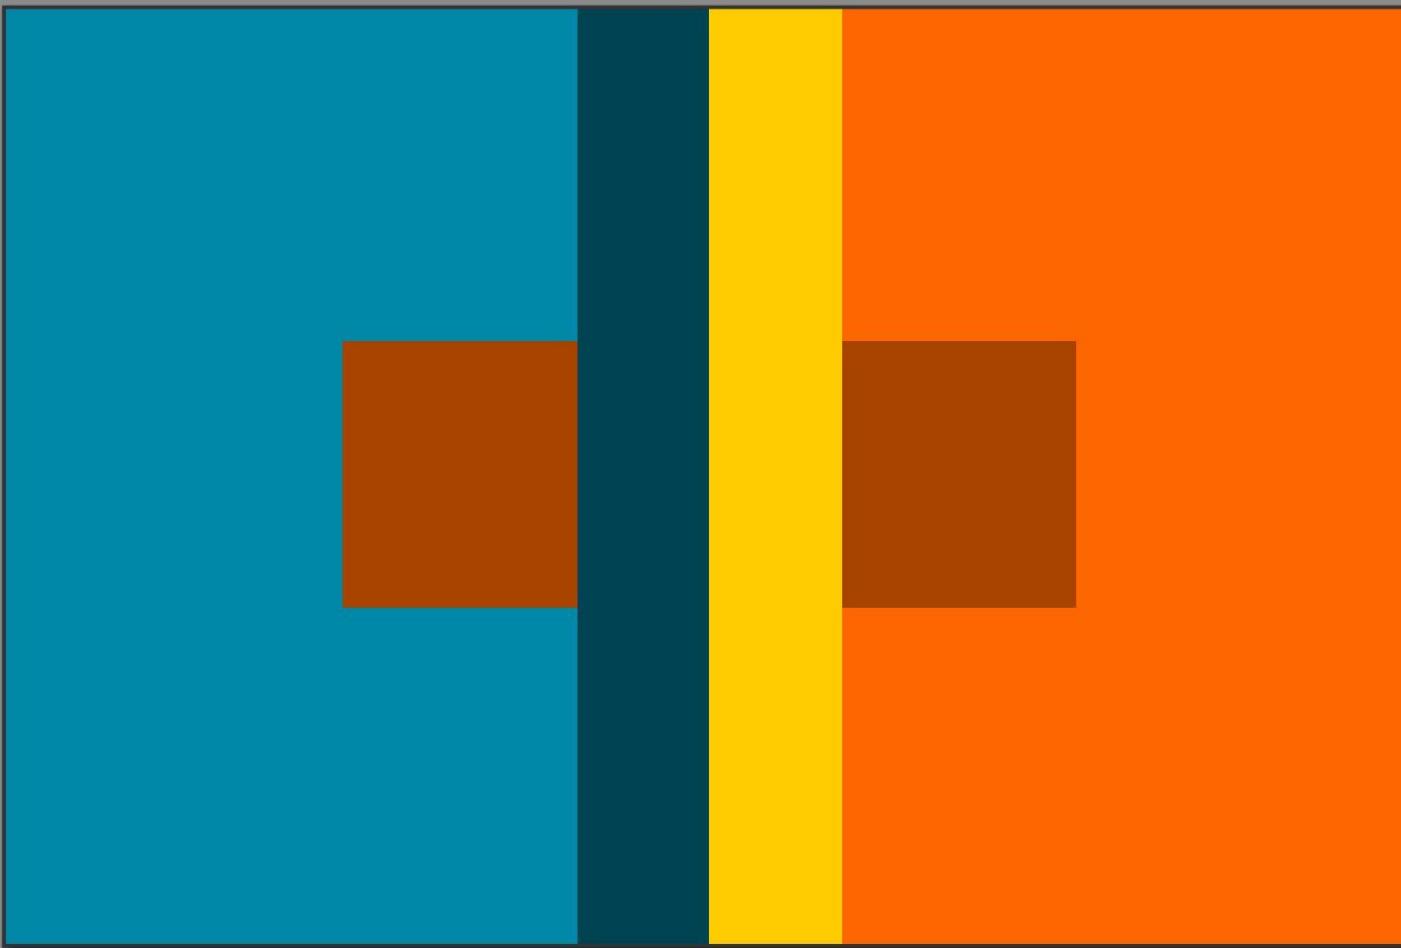

Contrast Effects

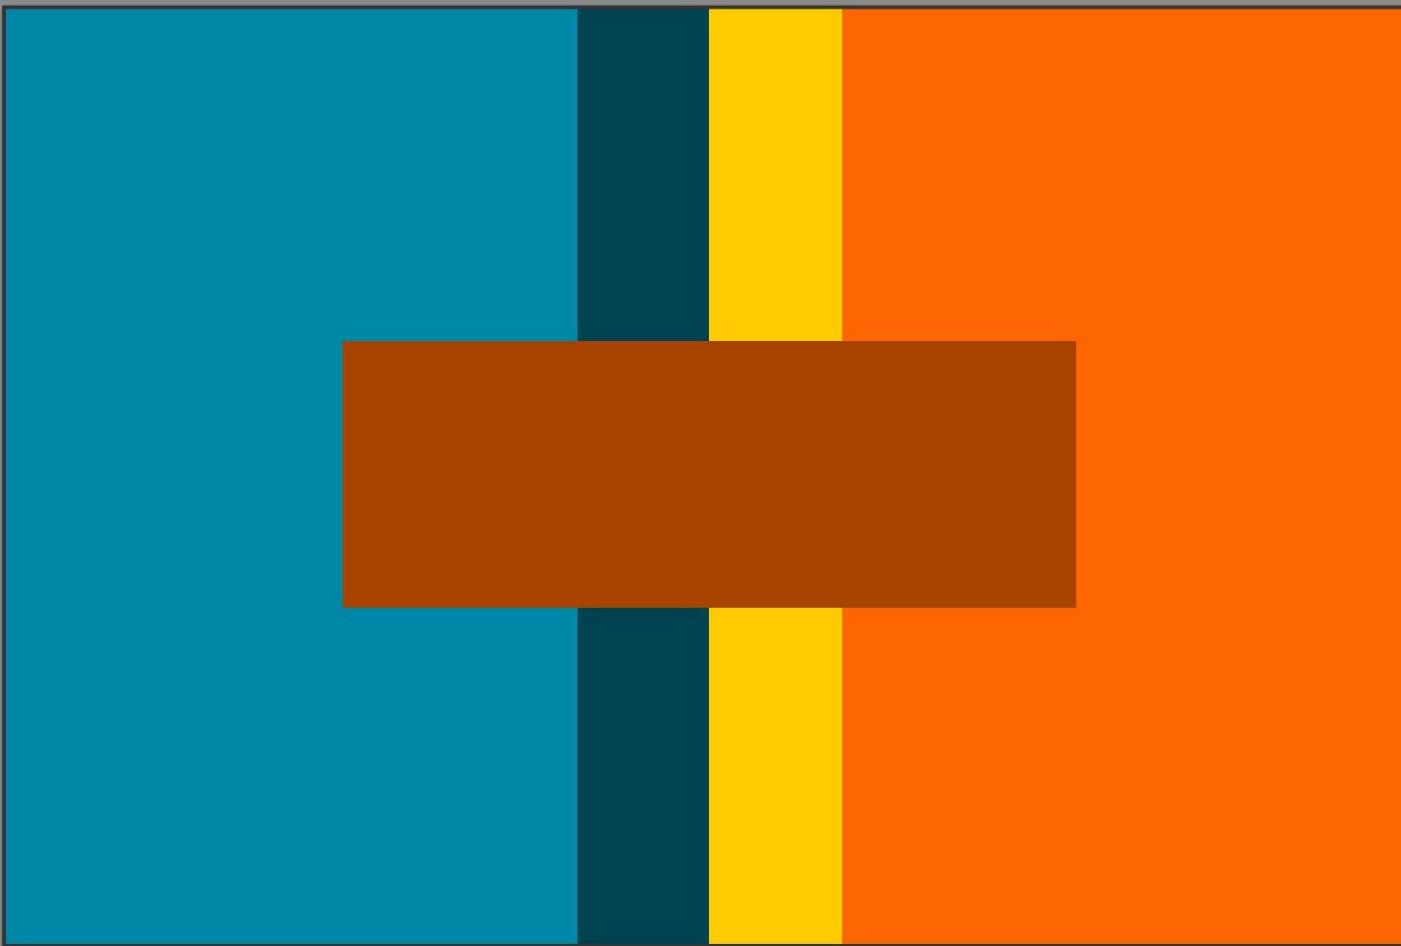

- Result of center/surround cells
- Simultaneous or successive
- Juxtaposition of colors effects our perception of them
- Complimentary colors often most effected

- The terms "simultaneous contrast" and "successive contrast" refer to visual effects in which the appearance of a patch of light (the "test field") is affected by other light patches ("inducing fields") that are nearby in space and time, respectively.
- The names are somewhat misleading since both simultaneous and successive contrast involve inducing fields that are close in both time and space.

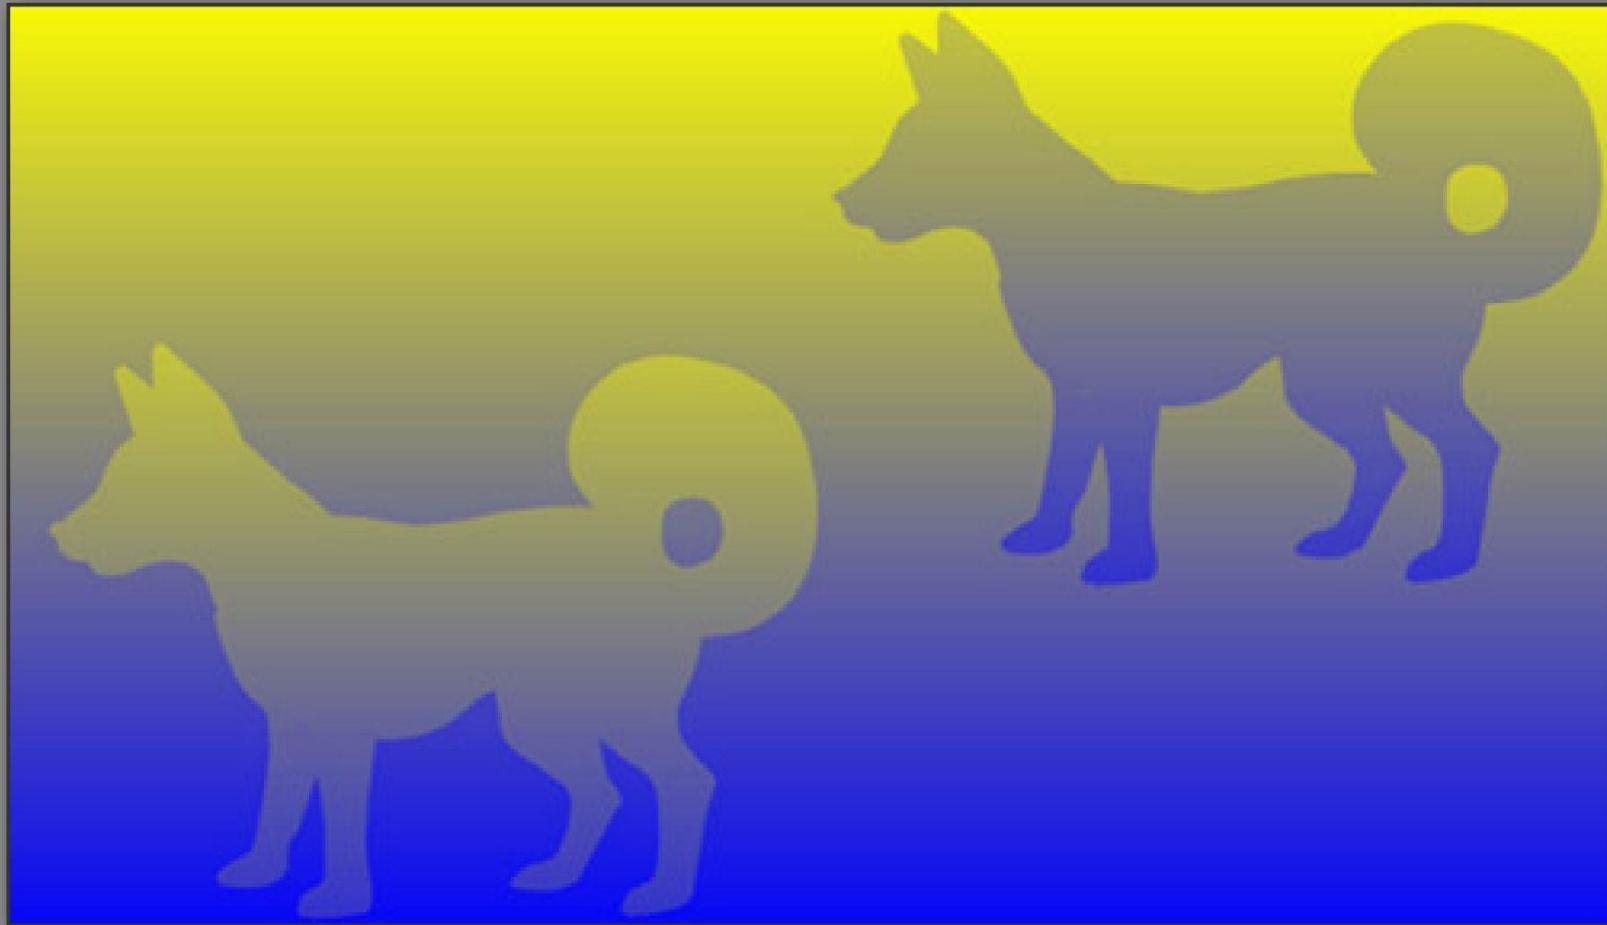

Simultaneous Contrast

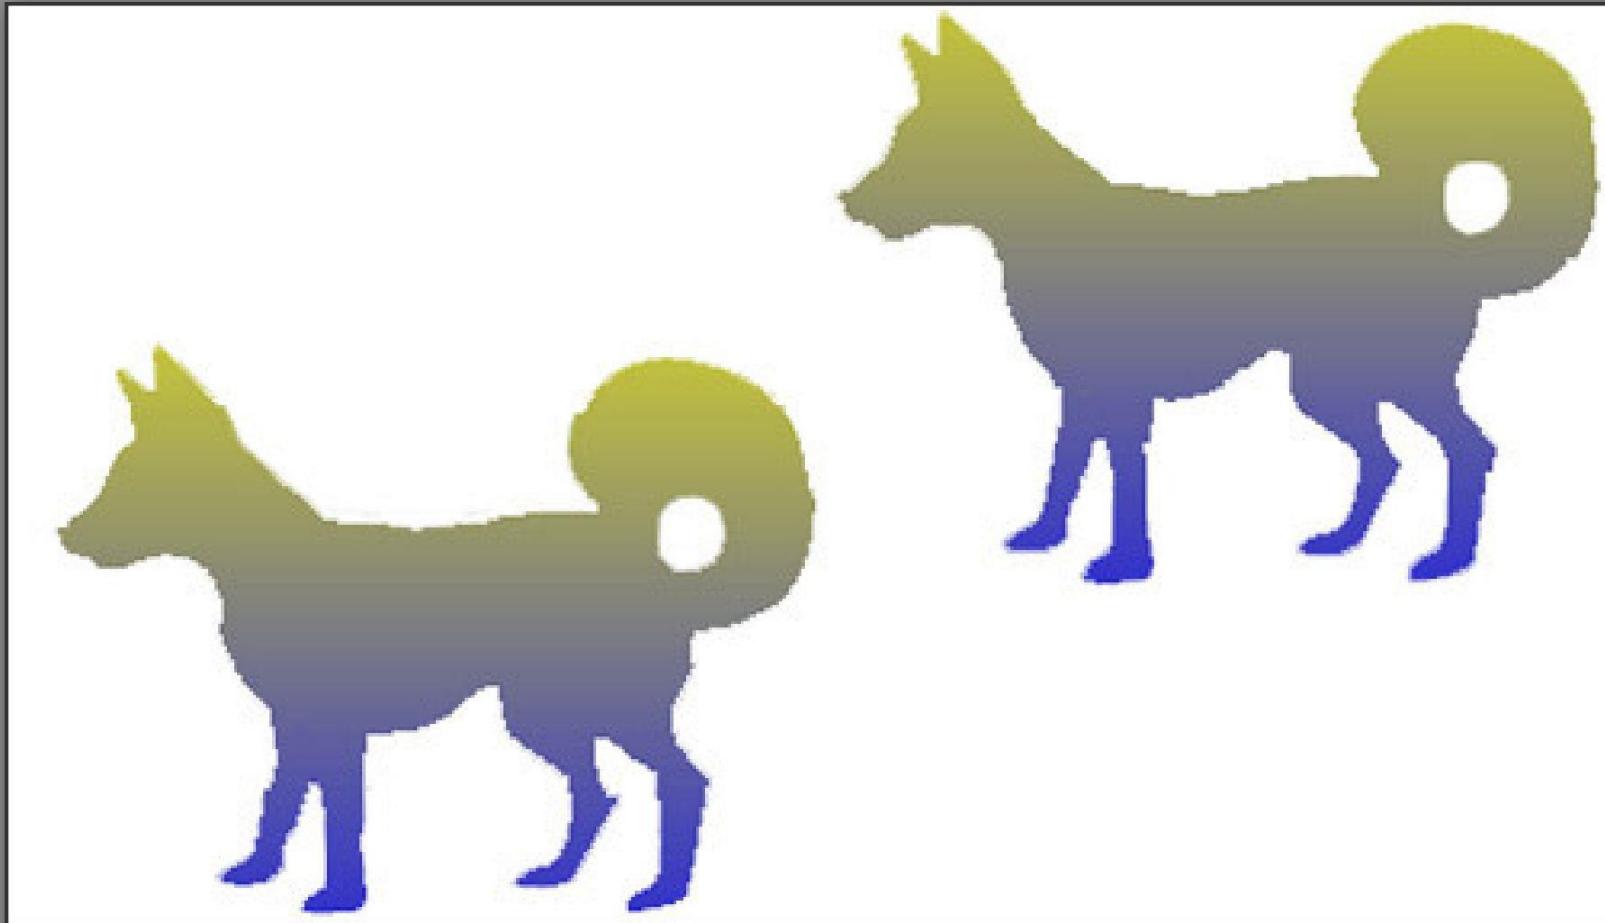

Simultaneous Contrast

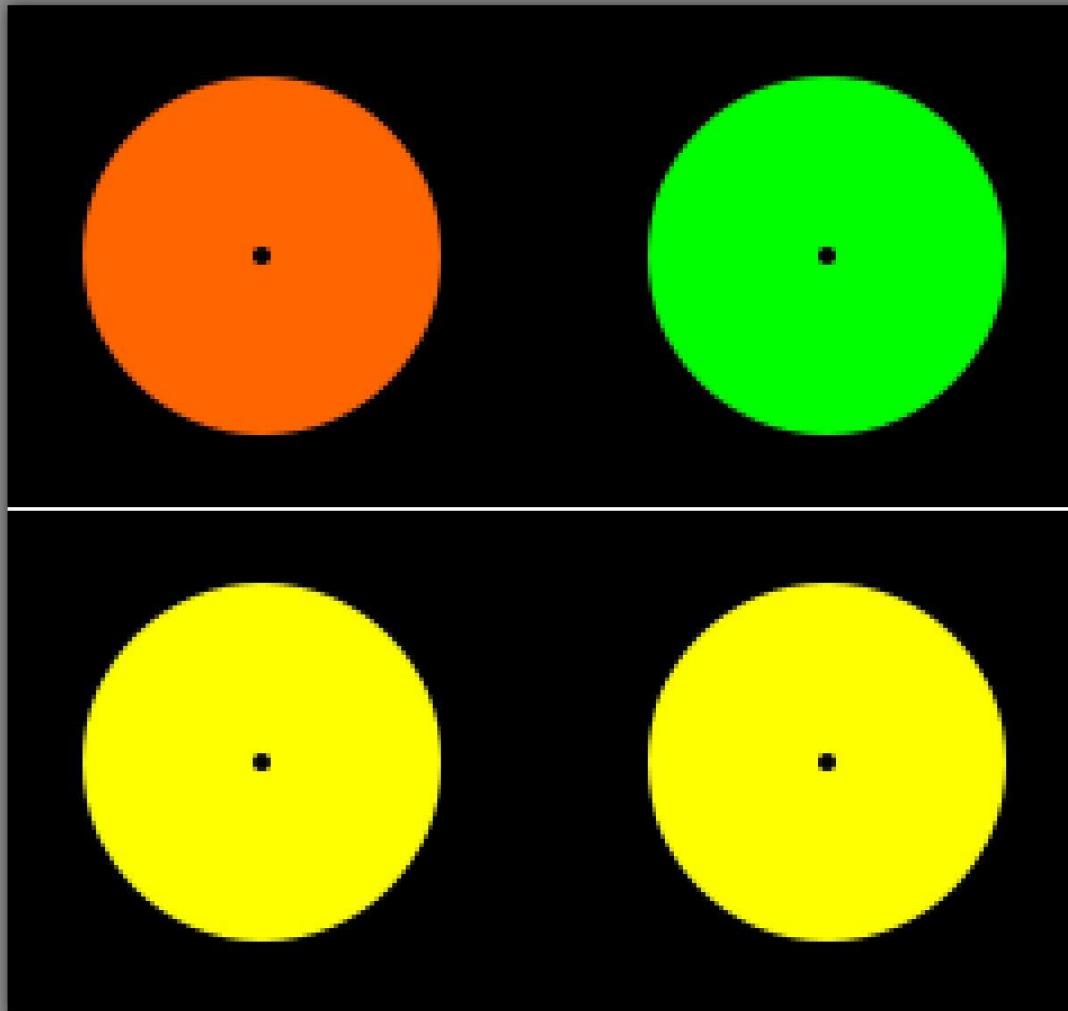

Simultaneous Contrast

Simultaneous Contrast

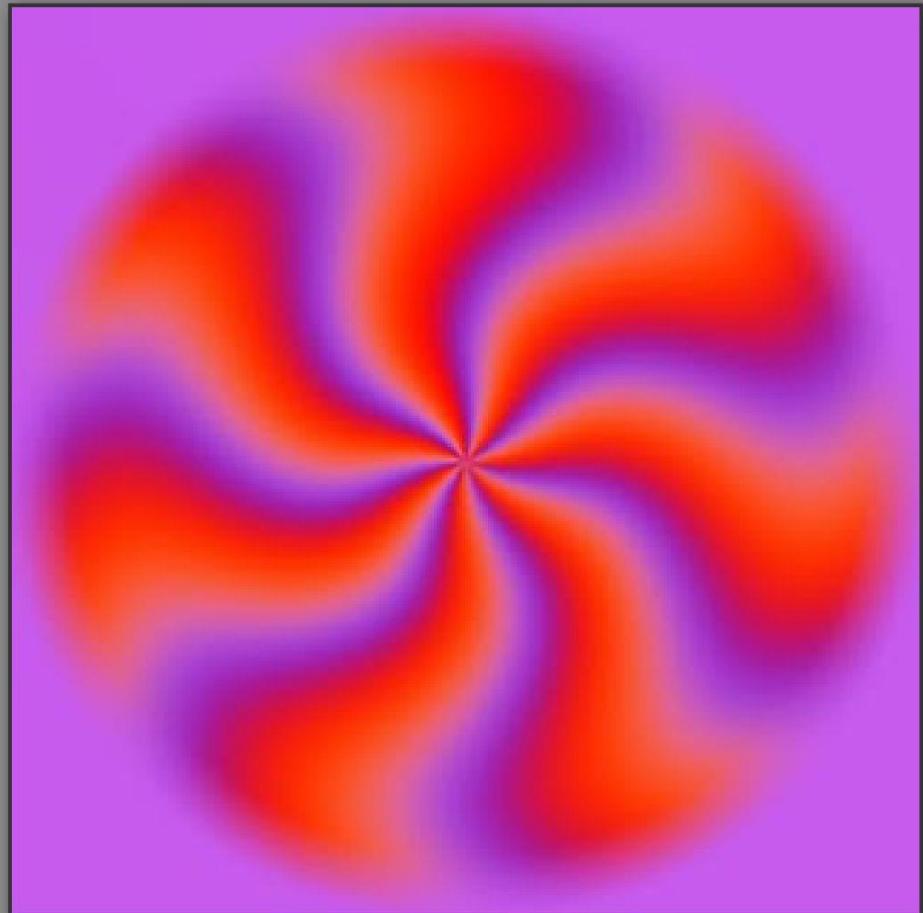

Successive Contrast

Equiluminant Colors

- Strong contrast causes shapes to be seen by color sensitive cell
- Equiluminance hides positions from light sensitive cells
- Flickering/movement caused by this disconnect

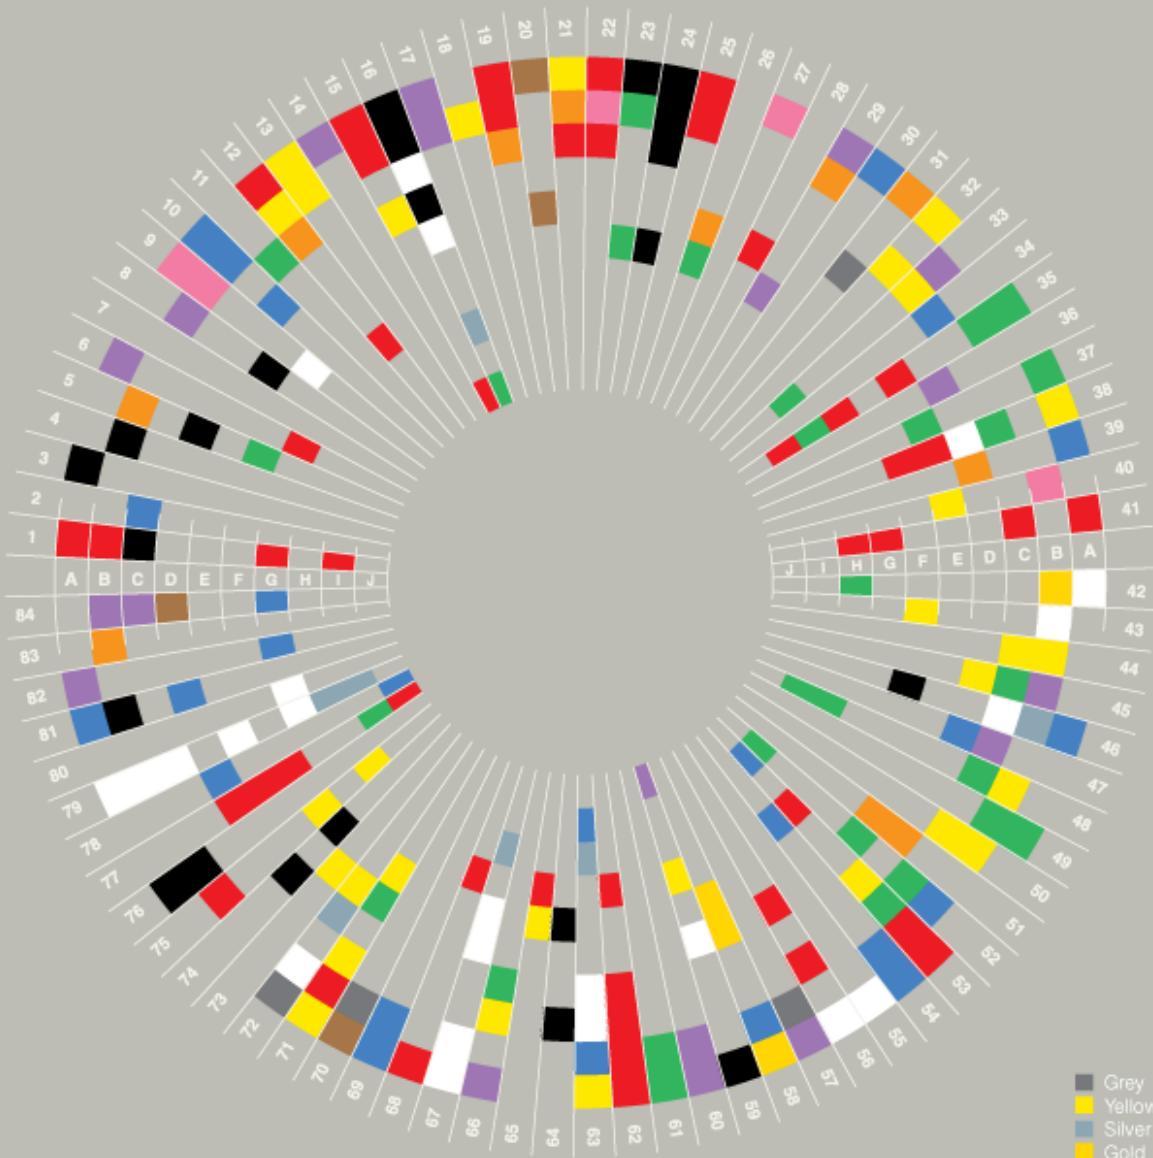

Other perceptual aspects

„This is Van Gogh's last painting before he committed suicide.“

Colours In Culture

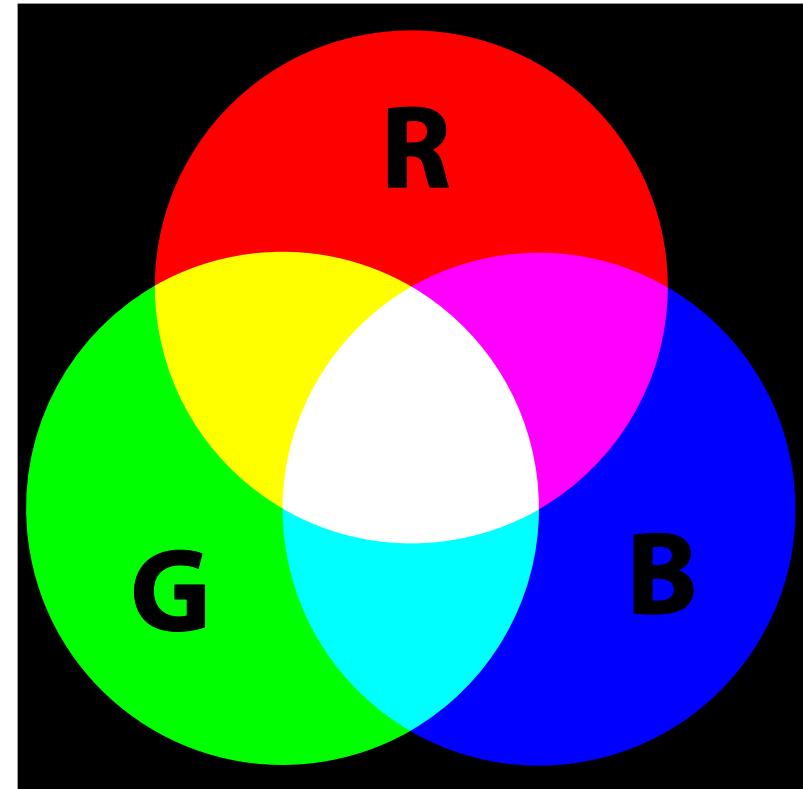

A	Western / American	F	Asian
B	Japanese	G	Eastern European
C	Hindu	H	Muslim
D	Native American	I	African

Color Mixing, Color Models, Color Interpolation

- Additive color mixing:
 - Light rays with different spectra of light come together
 - The spectra add up
 - The result is a different spectrum of light, i.e., color.
- Example RGB:
 - Monitors
- Note: Additive color mixing can also be done with other color models, including CMYK

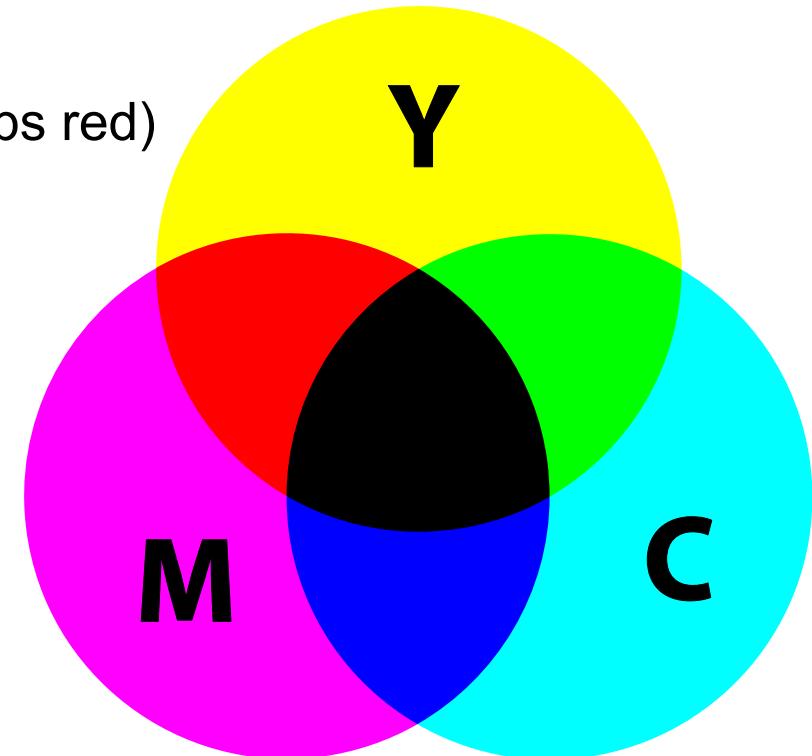

- Subtractive color mixing:

- A light ray with a (white) spectrum of light hits a surface
- It is being reflected
- The surface **absorbs** some wavelengths of light
- The result is a different spectrum of light, i.e., color.

- Example CMY(K):

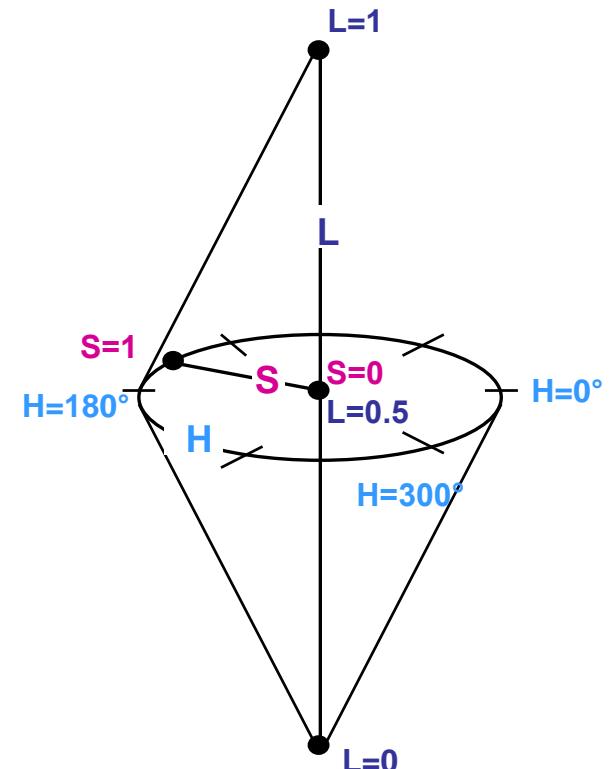

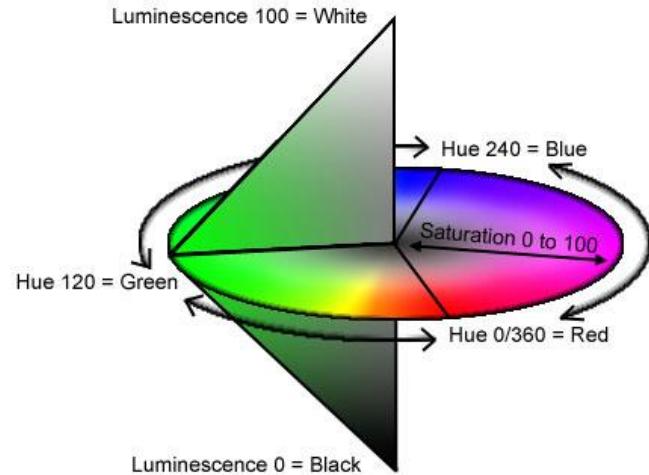

- Cyan: complement of red (= absorbs red)
- Magenta: complement of green
- Yellow: complement of blue
- K = black ink to hide
color mixing imperfections
- Note: Subtractive color mixing
can also be done
with other color models,
including RGB

- Color Models are a way to encode a spectrum of light
 - HSL
 - HSV
 - RGB
 - CMYK
 - many more...

HLS System

- **Hue**
classifies a color as red, green, blue, or mixture of these. The hues are given on a circle.
- **Lightness**
depends on the amount of light
- **Saturation**
describes the gray portion of the color
- Perception-oriented color system

HSV System

- **Hue**

classifies a color as red, green, blue, or mixture of these. The hues are given on a circle.

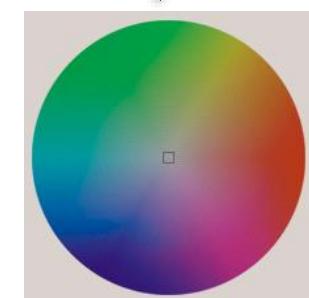

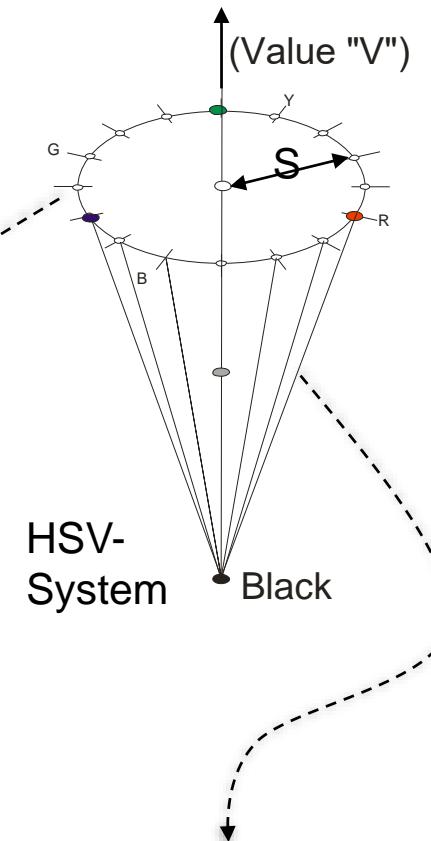

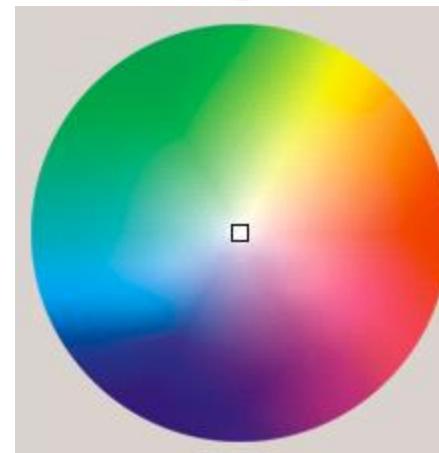

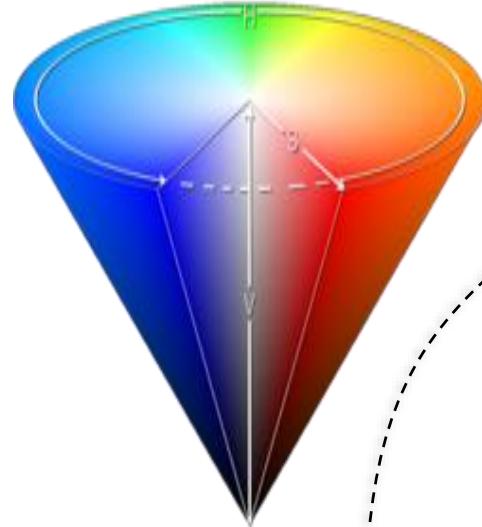

- **Saturation**

describes the gray portion of the color

- **Value**

depends on the amount of light

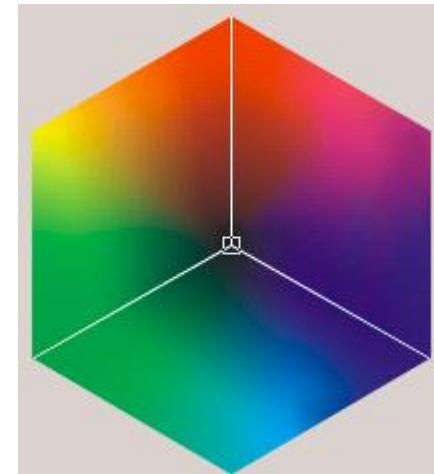

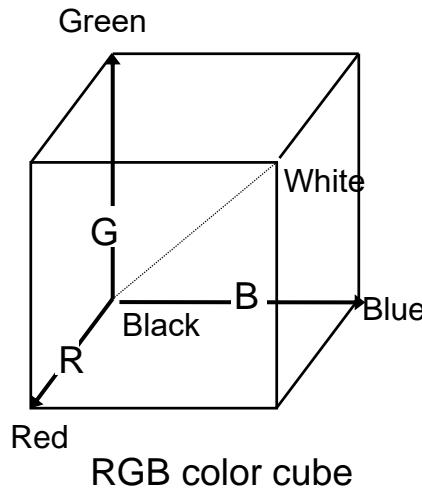

- Perception-oriented color system

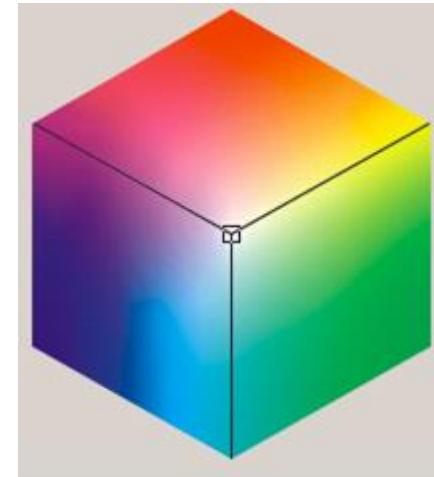

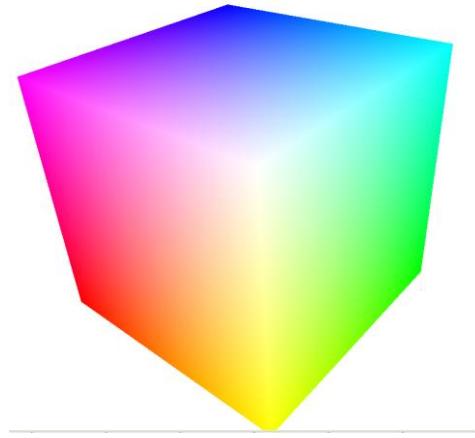

cuts through the HSV cone at v=1 and v=0.5

RGB System

- Red
- Green
- Blue

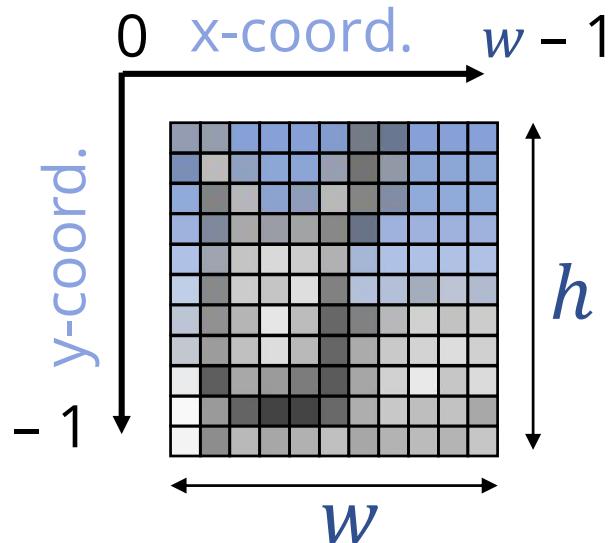

- Technology-oriented color system
- Describes a color by mixing three primary colors

RGB Model

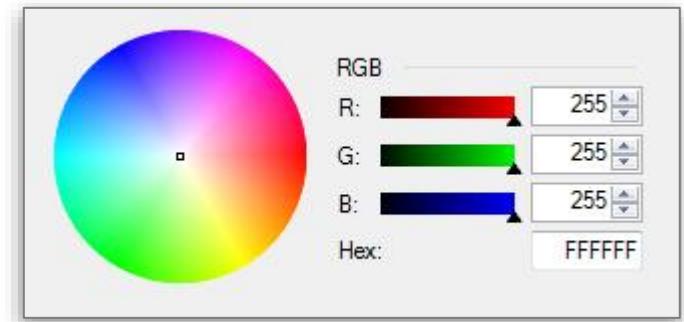

Bitmap (Pixel Display)

- Screen: $w \cdot h$ discrete pixels
 - Origin: usually upper left
- Varying color per pixel

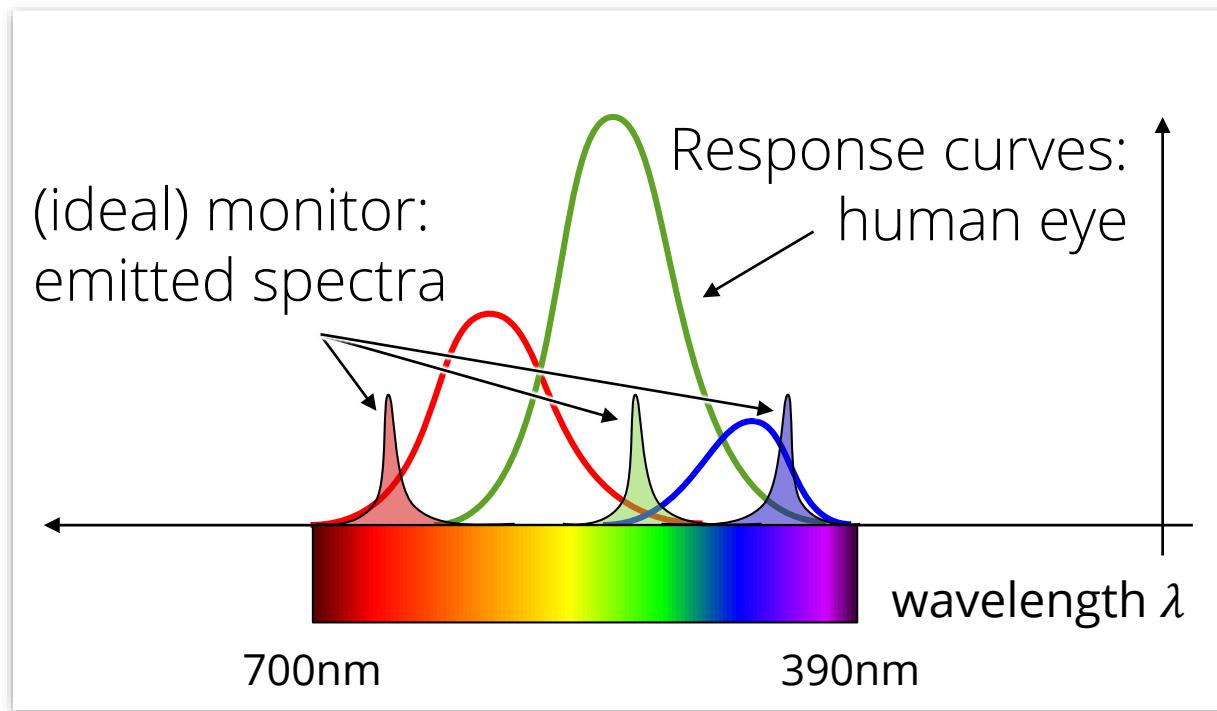

RGB Model

- Every pixel can emit *red*, *green*, *blue* light
- Intensity range:
 - Usually: bytes 0...255
 - 0 = dark
 - 255 = maximum brightness

Human Vision

(curves: schematic, not accurate)

Create color impressions

- Basis for three-dimensional color space
- Wide spacing, narrow bands: purer colors
 - Otherwise: washed out colors

Opera W HSL and HSV - Wikipedia, + https://en.wikipedia.org/wiki/HSL_and_HSV#Converting_to_RGB + dict SE => EN Heise Kayleigh lokal Kayleigh Holger Review Manuals Homepage HTML, CSS, JS TXC Temp Lecture Group KTH Ivo TopoInVis 2015

amounts of R , G , and B to reach the proper lightness or value.^[19]

From HSV [edit]

Given a color with hue $H \in [0^\circ, 360^\circ]$, saturation $S_{HSV} \in [0, 1]$, and value $V \in [0, 1]$, we first find chroma:

$$C = V \times S_{HSV}$$

Then we can find a point (R_1, G_1, B_1) along the bottom three faces of the RGB cube, with the same hue and chroma as our color (using the intermediate value X for the second largest component of this color):

$$H' = \frac{H}{60^\circ}$$

$$X = C(1 - |H' \bmod 2 - 1|)$$

$$(R_1, G_1, B_1) = \begin{cases} (0, 0, 0) & \text{if } H \text{ is undefined} \\ (C, X, 0) & \text{if } 0 \leq H' < 1 \\ (X, C, 0) & \text{if } 1 \leq H' < 2 \\ (0, C, X) & \text{if } 2 \leq H' < 3 \\ (0, X, C) & \text{if } 3 \leq H' < 4 \\ (X, 0, C) & \text{if } 4 \leq H' < 5 \\ (C, 0, X) & \text{if } 5 \leq H' < 6 \end{cases}$$

Fig. 24. A graphical representation of RGB coordinates given values for HSV.

Finally, we can find R , G , and B by adding the same amount to each component, to match value:

$$m = V - C$$

$$(R, G, B) = (R_1 + m, G_1 + m, B_1 + m)$$

From HSL [edit]

- When using a specific color model, we can interpolate between two colors by treating them like vectors and using linear interpolation.

Example:

$$\begin{pmatrix} R \\ G \\ B \end{pmatrix} = (1 - t) \begin{pmatrix} R_1 \\ G_1 \\ B_1 \end{pmatrix} + t \begin{pmatrix} R_2 \\ G_2 \\ B_2 \end{pmatrix}$$

- It is often perceptually better, to interpolate in the HSV or other perception-based models!

Example of *changing the saturation*:

$$\begin{pmatrix} H \\ S \\ V \end{pmatrix} = \begin{pmatrix} H \\ (1 - t)S_1 + tS_2 \\ V \end{pmatrix}$$

Transparency

Transparency

- “Alpha-blending”
- α = “opacity”
- Color + opacity: $\text{RGB}\alpha$

Blending

- Mix in α of front color, keep $1 - \alpha$ of back color

$$\mathbf{c} = \alpha \cdot \mathbf{c}_{front} + (1 - \alpha) \cdot \mathbf{c}_{back}$$

- Not commutative! (order matters)
 - unless monochrome
